

4.3.6 Other Survey Results

4.3.6.1 Roadkill

No roadkill was observed along any of the roadways adjacent to the subunits of PMA 3 during any of the surveys conducted.

4.3.6.2 Drainages, Channels, Culverts, and Detention Basins

Figures 9a-9f indicate mapped culverts, detention basins, and maintenance access roads in PMA 3.

A culvert is at the southwest corner of subunit 3-1a. Another culvert is in subunit 3-1b at the end of the cul-de-sac to the west. These culverts likely convey residential runoff. A culvert is along the drainage on the north side of subunit 3-1c. Culverts connect subunits 3-2aW and 3-2aE at the north end under Oleander Avenue. Several culverts are along or outside the southern edges of subunits 3-2b and 3-2c; and along or outside the northern edges of subunits 3-3a, 3-3b, and 3-3c. These culverts convey runoff from the adjacent slopes and Olympic Parkway.

The culverts that connect subunits are constructed to convey minor water flow. They would be large enough for small mammals, amphibians, and reptiles to pass through when dry or nearly dry. Medium-sized mammals, such as raccoon, fox, coyote, and bobcat, could potentially use some of the larger culverts. Large mammals, such as southern mule deer and mountain lion, are not expected to use these culverts as movement corridors.

Two detention basins are mapped in PMA 3: at the eastern end of the drainage in subunit 3-3b and the western end of the drainage in subunit 3-3c.

4.3.6.3 Wildlife Movement Corridor

In general, subunits in PMA 3 are situated sufficiently close together to allow for unimpeded bird movement between subunits. However, in many instances, roads that separate subunits likely decrease the number of terrestrially mobile animals that successfully cross from one subunit to another. Major roads, such as Otay Lakes Road, East H Street, Corral Canyon Road, and Telegraph Canyon Road, are not expected to provide significant pedestrian wildlife movement due to traffic volume and/or physical barriers such as cement lane dividers. Figures 9b, 9c, 9e, and 9f indicate potential wildlife movement corridors or pathways in PMA 3. As mentioned above, the culverts identified are not large enough to support large mammals, but could potentially allow movement of small and medium-sized mammals, amphibians, and reptiles.

Subunits 3-1b and 3-1c are fairly close to subunits 2-2b and 2-2c; however, these PMAs are divided by Telegraph Canyon Road. The high volume of traffic on this well-traveled

road would preclude most land species from crossing safely from one subunit to another.

Subunit 3-1a is isolated from the other subunits. Pedestrian species would have to traverse approximately 1,000 feet and cross East Naples Street to reach the next closest subunit. Subunits 3-2aW and 3-2aE are similarly isolated from the next closest subunit, 3-2b, which is 2,300 feet away across residential neighborhoods.

Wildlife species could move between subunits 3-2b and 3-2c largely unimpeded. Wildlife species would also be able to move between subunits 3-3a, 3-3b, and 3-3c. However, Olympic Parkway would hinder the pedestrian movement of species between these two sets of subunits.

4.3.6.4 Dumping, Trespassing, and Vagrant Encampments

No areas of dumping, trespassing, or vagrant encampments were mapped in PMA 3.

4.4 PMA 4

PMA 4 consists of 18 subunits totaling 310.0 acres. All figures pertaining to PMA 4 are located at the end of this section, in numerical order. Figure 10 presents an overview of the subunits and Figure 11 is the locator map for Figures 11a-11m.

An additional Otay tarplant preserve is within the PMA 4 boundary. This preserve is located east of subunit 4-1h (Figure 11f). The homeowners' association (HOA) for the Eastlake I development is the party responsible for this area. The preserve currently supports Otay tarplant, as well as invasive non-native species such as pampas grass, sweet fennel, and annual grasses. Due to the invasion by non-native weed species, it appears that this preserve is currently not being actively managed.

4.4.1 Site Description

4.4.1.1 Topography

The eastern half of PMA 4 is bisected by Long Canyon, which drops from 430 feet AMSL in the center of the area to 100 feet in the northeastern corner. Steep canyons surrounding it and other arroyos dominate the landscape in the western and northern parts of the area. The southern part of the site has a gentle, south-facing slope above Telegraph Canyon. The western half of the area is composed of rolling hills, with hilltops above 600 feet AMSL (USGS 1955, 1967a).

4.4.1.2 Soils

PMA 4 contains the following soil types: Diablo clay, Diablo-urban land complex, Linne clay loam, and Olivenhain cobbly loam. Diablo clay and Linne clay loam soils predominate throughout PMA 4. Diablo clays are most common, with Diablo-urban land complex soils mapped in the flat, southern area that has long been developed, and Linne clay loam soils on the gentle slopes in the north-central part of the area. Olivenhain cobbly loam is found on some of the steep slopes in the eastern part of the site.

4.4.2 Botanical Resources

There are 10 vegetation communities present in PMA 4: Diegan coastal sage scrub, disturbed Diegan coastal sage scrub, maritime succulent scrub, disturbed maritime succulent scrub, mule fat scrub, southern willow scrub, non-native grassland, freshwater marsh, tamarisk scrub, and disturbed. The acreages of these vegetation communities within PMA 4 are shown in Table 5. Vegetation communities mapped on-site are shown on Figures 11a-11m. The following text provides detailed descriptions of the vegetation communities specific to PMA 4. Please see Attachment 3 for complete general vegetation community descriptions.

Plants historically observed are listed in Attachment 4. Attachment 17 provides a list of plants identified during the current surveys in each subunit of PMA 4.

**TABLE 5
VEGETATION COMMUNITIES AND
LAND COVER TYPES ON PMA 4**

Vegetation Type	Acres
Maritime succulent scrub	92.8
Disturbed maritime succulent scrub	1.3
Diegan coastal sage scrub	120.8
Disturbed Diegan coastal sage scrub	13.7
Southern willow scrub	14.2
Mule fat scrub	1.1
Fresh water marsh	1.0
Native grassland	6.7
Disturbed native grassland	2.8
Non-native grassland	37.6
Tamarisk scrub	1.7
Eucalyptus woodland	0.2
Disturbed	16.1
Total for PMA 4	310.0

4.4.2.1 Maritime Succulent Scrub (92.8 acres) and Disturbed Maritime Succulent Scrub (1.3 acres) (Holland Code 32400)

Maritime succulent scrub in PMA 4 consists of San Diego barrel cactus, Mohave yucca, snake cholla, and jojoba. This vegetation community occurs mainly on south-facing slopes and supports sensitive wildlife species such as coastal cactus wren. Maritime succulent scrub average shrub height ranges from three feet in open or sage scrub dominated areas to eight feet in woody species or coast cholla dominated areas.

4.4.2.2 Diegan Coastal Sage Scrub (120.8 acres) and Disturbed Diegan Coastal Sage Scrub (13.7 acres) (Holland Code 32500)

Diegan coastal sage scrub is considered to be high-quality habitat for a number of species that reside in the area. This community is dominated by species such as California sagebrush, California buckwheat, broom baccharis, common encelia, coast goldenbush, lemonadeberry, San Diego sand aster, jojoba, and San Diego County viguiera. Areas dominated by California sagebrush and California buckwheat range in average shrub height from three to six feet. These areas tend to occur on south-facing slopes. Lemonadeberry-dominated areas average shrub height ranges from 8 to 15 feet. These areas are generally on the north-facing slopes.

Disturbed Diegan coastal sage scrub is present in areas that include a greater percentage of weedy, non-native species. These include star-thistle, Russian thistle, tree tobacco, horehound, black mustard, wild oats, and bromes.

4.4.2.3 Southern Willow Scrub (14.2 acres) (Holland Code 63320)

Within PMA 4, southern willow scrub is primarily dominated by western sycamore, western cottonwood, Gooding's black willow, arroyo willow, and red willow. Southern willow scrub average vegetation height varies depending on the age and type of tree species present. In general, vegetation height averages 30 feet, and can be higher for more mature stands and/or those dominated by western sycamores and western cottonwoods.

4.4.2.4 Mule Fat Scrub (1.1 acres) (Holland Code 63310)

Mule fat dominates this small patch in subunit 4-2d. Due to the proximity to tamarisk scrub, this community is in danger of being invaded by the highly invasive tamarisk. Mule fat scrub average shrub height ranges from six to eight feet.

4.4.2.5 Freshwater Marsh (1.0 acre) (Holland Code 52400)

Freshwater marsh is dominated by salt marsh fleabane (*Pluchea odorata*), broad-leaved cattail (*Typha latifolia*), and salt heliotrope (*Heliotropium curassavicum*). A very narrow band of this community is present in the drainage that bisects the coastal sage scrub and maritime succulent scrub vegetation on the eastern half of subunit 4-1e. The average vegetation height of a freshwater marsh is approximately five to seven feet.

4.4.2.6 Native Grassland (6.7 acres) and Disturbed Native Grassland (2.8 acres) (Holland Code 42100)

Native grassland patches occur within the Diegan coastal sage scrub vegetation in subunit 4-2a and are dominated by species including needlegrass, common goldenstar, and blue-eyed grass. Non-native grass species such as wild oats and bromes have invaded the native grassland areas to some extent. Native grasslands range in average vegetation height from one to three feet.

The area mapped as disturbed native grassland is in subunit 4-2b, adjacent to a patch of disturbed land. The disturbed native grassland is dominated by the same native grass species as above, but with a greater percentage of bare ground and non-native grassland species.

4.4.2.7 Non-native Grassland (37.6 acres) (Holland Code 42200)

This vegetation community is dominated by non-native species including bromes and wild oats. The average height of this vegetation ranges from two to four feet.

4.4.2.8 Tamarisk Scrub (1.7 acres) (Holland Code 63810)

Tamarisk scrub is dominated by the non-native and highly invasive tamarisk. This weedy vegetation community is usually a monoculture of tamarisk that has supplanted native wetland plant species. Tamarisk typically invades following disturbance in sandy or gravelly braided washes or intermittent streams, often in areas where high evaporation creates high salinity in the stream (Holland 1986).

4.4.2.9 Eucalyptus Woodland (0.2 acre) (Holland Code 11100)

Eucalyptus woodland occurs in subunit 4-2a between residential housing, coastal sage scrub, and non-native grassland. Eucalyptus trees provide bird species, including raptors, with foraging and nesting opportunities. Eucalyptus woodlands range in height from 30 to 50 feet or higher in more mature stands.

4.4.2.10 Disturbed (16.1 acres) (Holland Code 12000)

Disturbed habitat is found in PMA 4 and includes trails and open areas that have been cleared of vegetation. These disturbed areas have a mixture of native and non-native vegetation including California buckwheat, broom baccharis, wild oat, star-thistle, and filaree.

The City of Chula Vista and SDG&E maintain access roads in the Preserve. The access roads are generally wider than pedestrian trails to allow for vehicular access. Specifically, an SDG&E transmission line traverses the center of PMA 4 in a southwest to northeast direction. Associated access roads for the transmission line are in subunits 4-3d, 4-2b, and 4-1dS.

4.4.3 Zoological Resources

Attachment 8 provides a complete list of all wildlife species present in PMAs 1-4. Attachment 18 provides a list of species present within each subunit of PMA 4. Wildlife observed includes seven reptile species, forty-eight species of birds, and five species of mammals.

4.4.3.1 Amphibians

No amphibians were observed in PMA 4. Some common species expected to occur in the drainages include the Pacific treefrog and bullfrog.

4.4.3.2 Reptiles

The side-blotched lizard was observed in PMA 4. Other common reptile species with the potential to occur include western fence lizard and San Diego gophersnake.

4.4.3.3 Birds

Bird species commonly observed in the Diegan coastal sage scrub and maritime succulent scrub include Anna's hummingbird, bushtit, wrentit, western scrub-jay, white-crowned sparrow, spotted towhee, coastal California gnatcatcher, blue-gray gnatcatcher, California towhee, Bewick's wren, and house finch.

Riparian vegetation communities provide habitat for many resident and migratory bird species. Species observed within the southern willow scrub include common yellowthroat, lesser goldfinch, and song sparrow.

Birds and raptors observed in non-native grassland and disturbed environments include mourning dove, northern mockingbird, house finch, American crow, common raven (*Corvus corax clarionensis*), western meadowlark, red-tailed hawk, and European starling (*Sturnus vulgaris*).

4.4.3.4 Mammals

Mammal species observed and detected within PMA 4 include cottontail rabbit, coyote, raccoon, southern pocket gopher, and southern mule deer. These are likely to be present in any of the vegetation communities and habitats found within PMA 4.

4.4.4 Sensitive Species

For purposes of this report, a species will be considered sensitive if it is: (1) listed by state or federal agencies as threatened or endangered or are candidates or proposed for such listing; (2) considered rare, endangered, or threatened by the state of California and listed in the NDDB (2003a, 2003b, 2003c, 2003d, 2003e); (3) a narrow endemic or covered species in the City of Chula Vista MSCP Subarea Plan (City of Chula Vista 2003); (4) on Lists 1B or 2 of the CNPS *Inventory of Rare and Endangered Vascular Plants of California* (2001); or (5) considered sensitive by local conservation organizations or specialists. Noteworthy plant species are considered to be those that are on Lists 3 or 4 of the CNPS *Inventory*. Sensitive habitat types are those identified by the NDDB (State of California 2003e) and Holland (1986). Assessments for the potential occurrence of sensitive or noteworthy species are based upon known ranges and habitat preferences for the species and species occurrence records from the NDDB.

Attachment 5 lists the sensitive plant species known to occur or with potential to occur in the PMAs. Attachment 6 lists sensitivity status codes. Attachment 7 provides complete general descriptions of all sensitive plant species discussed in this document. Attachment 9 lists the sensitive animal species known to occur or with potential to occur in the PMAs. Attachment 10 provides complete general descriptions of all sensitive wildlife species discussed in this document. Descriptions include sensitivity status, life

history, and range. Figures 11a-11m map the locations of sensitive plants and wildlife detected during the current surveys.

4.4.4.1 Sensitive Plant Species

In PMA 4, 13 sensitive and noteworthy plant species were observed during the current surveys. Several sensitive plant species are historically known from the PMA or are known to occur in the vicinity of the site, but were not observed during surveys. Many of these species, such as shrubs, would have been easily observed on the site during plant surveys. Because they were not observed, they are considered to have a low potential for occurrence or are not expected to occur. In other cases, species that are perennial or annual herbs may not have been detected due to timing constraints. Every PMA subunit was surveyed at least once; PMA subunits with an expectation of supporting rare plants were resurveyed for a minimum of two times to account for seasonal differences. Because some PMA subunits were only surveyed once during the year this could have led to the smaller herbaceous species not being detected on these subunits even though they may be present in small numbers. These species are discussed below.

Plant counts are provided for most of the sensitive species and the highest priority for conducting plant counts was for state and federally listed and MSCP covered species, including narrow endemics. In some cases, counts were not made for species that are regionally considered sensitive by CNPS, such as San Diego County viguiera or small-flowered morning glory because the level of effort required to do so would have diminished our ability to accomplish higher priority counts for listed and covered species.

Observed

San Diego thornmint (*Acanthomintha ilicifolia*)—a narrow endemic species covered under the MSCP. Populations of this species are present in subunits 4-1cW (approximately 500 individuals) and 4-2b (approximately 75 individuals).

California adolphia (*Adolphia californica*). A few shrubs were observed in subunits 4-1dN, 4-1dS, 4-1e, 4-1f, and 4-2c in the Diegan coastal sage scrub.

Small-flowered morning glory (*Convolvulus similans*). This species is present along the drainages of subunits 4-1a (thousands of individuals), 4-1b, 4-1cW, 4-2a (thousands of individuals), and 4-2b.

Orcutt's bird's-beak (*Cordylanthus orcuttianus*)—an MSCP covered species. A few individuals of this species are present in subunit 4-1g.

Snake cholla (*Cylindropuntia californica* var. *californica* [= *Opuntia californica* var. *californica*])—a narrow endemic species covered under the MSCP. A few individual snake chollas occur in the Diegan coastal sage scrub in subunit 4-1cW.

Otay tarplant (*Deinandra conjugens* [= *Hemizonia conjugens*])—a narrow endemic species covered under the MSCP. This species is present in subunits 4-1a (30,000 individuals), 4-1cW (50 individuals), 4-2a, and 4-2b.

Variegated dudleya (*Dudleya variegata*)—a narrow endemic species covered under the MSCP. Approximately 50 variegated dudleya individuals are present in subunit 4-2a.

San Diego barrel cactus (*Ferocactus viridescens*)—an MSCP covered species. Small populations of San Diego barrel cactus are scattered throughout subunits 4-1a, 4-1cE, 4-1dS, 4-1e, 4-1f, and 4-1h (142 individuals).

Palmer's grappling hook (*Harpagonella palmeri* var. *palmeri*). This species is present in subunits 4-1a (150 individuals), 4-1b (100 individuals), 4-1cW (30 individuals), 4-2a (1,000 individuals), and a few individuals in subunit 4-2b.

Graceful tarplant (*Holocarpha virgata* ssp. *elongata*). One individual of this species was observed in subunit 4-1h.

Decumbent goldenbush (*Isocoma menziesii* var. *decumbens*). Several individuals of this species are present in PMA subunits 4-1f and 4-2c.

San Diego sand aster (*Lessingia filaginifolia* var. *filaginifolia* [= *Corethrogyne filaginifolia* var. *incana*]). Small, scattered populations of San Diego sand aster occur in the Diegan coastal sage scrub of most PMA 4 subunits.

California box thorn (*Lycium californicum*). This species is present in maritime succulent scrub adjacent to subunit 4-1cW.

Munz's sage (*Salvia munzii*). Munz's sage shrubs are present in subunit 4-1f and 4-1h (approximately 35 individuals) in the Diegan coastal sage scrub vegetation.

San Diego County viguiera (*Viguiera laciniata*). San Diego County viguiera shrubs are widely scattered in the coastal sage scrub vegetation of most PMA 4 subunits.

Noteworthy Species

The following noteworthy species are usually associated with desert plant communities. None of these species have any sensitivity status. Their occurrences in coastal San Diego County represent disjunct populations that are likely genetically isolated. Their presence is owed to the calcareous Linne series soils found in PMA 4.

California fagonia (*Fagonia laevis*). A few individual California fagonias are present in subunit 4-1dS. While not considered sensitive, these occurrences are noteworthy due to their presence at or just beyond the western extent of this species' range.

Desert bedstraw (*Galium proliferum*). Populations of desert bedstraw are present in subunits 4-2b and 4-2c. While not considered sensitive, these occurrences are noteworthy due to their presence beyond this species' range.

Water jacket (*Lycium andersonii*). This species is present in subunits 4-1a, 4-1cW, 4-1dS, 4-2a, and 4-2b. While not considered sensitive, these occurrences are noteworthy due to their presence beyond this species' range.

Not Observed

San Diego bur-sage (*Ambrosia chenopodifolia*). This species has a low potential to occur within the Diegan coastal sage scrub in PMA 4. One individual San Diego bur-sage occurs in PMA 1, which is the northern extent of its range.

San Diego ambrosia (*Ambrosia pumila*). San Diego ambrosia has a low potential to occur in the drainages of PMA 4. This species prefers sandy alluvium in creek beds, seasonally dry drainages, and floodplains. Clay soils are present in these areas in PMA 4.

South coast saltbush (*Atriplex pacifica*). There is a high potential for this species to occur in PMA 3. Suitable habitat present includes the open coastal sage scrub on Linne clay substrate.

Golden-spined cereus (*Bergerocactus emoryi*). There is a moderate potential for golden-spined cereus to occur given suitable habitat present and proximity to a known occurrence in PMA 2.

Orcutt's brodiaea (*Brodiaea orcuttii*). There is a low potential for this species to occur. Suitable habitat, which consists of chaparral communities with vernal pool areas, is not present in PMA 4.

Palmer's ericameria (*Ericameria palmeri* var. *palmeri* [= *Haplopappus palmeri* ssp. *palmeri*]). There is a low potential for Palmer's ericameria to occur in PMA 4. Suitable sandy loam soils do not occur in this PMA.

Cliff spurge (*Euphorbia misera*). No historical records of cliff spurge occur in PMA 4. There is a potential for occurrence in the maritime succulent scrub habitat.

San Diego marsh elder (*Iva hayesiana*). There is a potential for this species to occur in PMA 4, particularly adjacent to the on-site drainage.

Spiny rush (*Juncus acutus* ssp. *leopoldii*). There is a potential for this species to occur in the riparian habitats on PMA 4.

San Diego goldenstar (*Muilla clevelandii*). San Diego goldenstar typically grows in gravelly clay loam soils. There is a moderate potential for this species to occur, as the required substrate is present. However, these areas were surveyed extensively during sensitive plant surveys, general surveys, and focused surveys for coastal California gnatcatcher; if present, this species would have been detected. Nearby populations occur on Otay Mesa, Proctor Valley Road, and San Miguel Mountain.

Spreading navarretia (*Navarretia fossalis*). Suitable vernal pool habitat is not present on PMA 4. Spreading navarretia is not expected to occur.

Otay mesa mint (*Pogogyne nudiuscula*). Suitable vernal pool habitat is not present on PMA 4. Otay mesa mint is not expected to occur.

Nuttall's scrub oak (*Quercus dumosa*). There is a low potential for Nuttall's scrub oak to occur on the more densely vegetated north-facing slopes on PMA 4.

4.4.4.2 Sensitive Amphibians

No sensitive amphibians have been detected to date. One sensitive species with the potential to occur is the western spadefoot. This is discussed in more detail below.

Not Observed

Western spadefoot (*Spea hammondi*). The western spadefoot is a CDFG species of special concern. There is a low potential for this species to be present in the drainages of PMA 4.

4.4.4.3 Sensitive Reptiles

Three sensitive reptile species were detected in PMA 4. Several other species have a potential to occur. These species are discussed below.

Observed

Belding's orange-throated whiptail (*Aspidoscelis* [= *Cnemidophorus*] *hyperythrus beldingi*)—an MSCP covered species. Belding's orange-throated whiptail is a CDFG species of special concern. Belding's orange-throated whiptails were observed in subunits 4-1a and 4-2b, and are expected to occur in other scrub areas.

San Diego horned lizard (*Phrynosoma coronatum blainvillii*)—an MSCP covered species. This species is a CDFG species of special concern. A San Diego horned lizard was observed in subunit 4-2b. This species has a low potential to occur in the coastal sage scrub habitat throughout PMA 4, as its numbers are declining due to edge effects, likely including predation by domestic cats. Prior to urban development, this species would have been common on the mesa tops of PMA 4.

Red diamond rattlesnake (*Crotalus exsul*). The red diamond rattlesnake is a CDFG species of special concern. Red diamond rattlesnakes were observed in subunits 4-1a and 4-2b, and are expected to occur throughout PMA 4, particularly in south-facing Diegan coastal sage and maritime succulent scrub areas.

Not Observed

Coronado skink (*Eumeces skiltonianus interparietalis*). The Coronado skink is a CDFG species of special concern. There is a moderate potential for the Coronado skink to occur in the mesic areas near the drainage that traverses PMA 4.

Silvery legless lizard (*Anniella pulchra pulchra*). This species is a CDFG species of special concern. This species has a moderate potential to occur in scrub and riparian areas in PMA 4, particularly areas with loose soil or leaf litter.

Coastal western whiptail (*Cnemidophorus tigris multiscutatus*). This species has a moderate potential to occur in areas of sparse vegetation in PMA 4.

Coast patch-nosed snake (*Salvadora hexalepis virgultea*). The coast patch-nosed snake is a CDFG species of special concern. This species has a moderate potential to occur sparsely vegetated habitats with loose or rocky soil in PMA 4.

Two-striped garter snake (*Thamnophis hammondi*). The two-striped garter snake is a CDFG species of special concern. This species has a moderate potential to occur in the riparian or adjacent upland areas of PMA 4.

4.4.4.4 Sensitive Birds

Eleven sensitive bird species were observed in PMA 4. Several other species have the potential to occur. These species are discussed below.

Observed

Double-crested cormorant (*Phalacrocorax auritus albociliatus*). The double-crested cormorant is a CDFG species of special concern. This species was observed flying over subunit 4-1b. This species is not expected to use any of the resources within any of the PMAs, as there is no appropriate habitat available.

White-tailed kite (*Elanus leucurus*). The white-tailed kite is a CDFG fully protected species. This species was observed in subunits 4-1g and 4-1h. Suitable nesting habitat occurs on-site.

Northern harrier (*Circus cyaneus hudsonius*)—an MSCP covered species. The northern harrier is a CDFG species of special concern. Northern harriers were observed in subunit 4-1g. Suitable nesting habitat occurs along the major drainage in PMA 4.

Cooper's hawk (*Accipiter cooperii*)—an MSCP covered species. The Cooper's hawk is a CDFG species of special concern. Cooper's hawks were observed in subunits 4-1a, 4-2a, and 4-2b. Suitable nesting habitat occurs in the mature riparian vegetation.

Swainson's hawk (*Buteo swainsoni*)—an MSCP covered species. The Swainson's hawk is state listed as threatened. A Swainson's hawk was observed flying over subunit 4-1e. This species is not expected to breed in PMA 4, as the local breeding population has been extirpated (Unitt 1984).

American peregrine falcon (*Falco peregrinus*)—an MSCP covered species. The American peregrine falcon is a state endangered species. This species was observed flying over subunit 4-1a. The American peregrine falcon is not expected to nest on-site.

Least Bell's vireo (*Vireo bellii pusillus*)—an MSCP covered species. The least Bell's vireo is a state and federally listed endangered species. This species was observed in subunit 4-2b during the focused surveys conducted in 2003. The least Bell's vireo is expected to breed in the southern willow scrub of this subunit.

Coastal cactus wren (*Campylorhynchus brunneicapillus couesi*)—an MSCP covered species. The coastal cactus wren is a CDFG species of special concern. Coastal cactus wrens were observed in subunit 4-2a; nesting evidence was observed in subunits 4-1a and 4-2b. This species is expected to occur in large cactus patches within other subunits of PMA 4.

Coastal California gnatcatcher (*Polioptila californica californica*)—an MSCP covered species. The coastal California gnatcatcher is a federally listed threatened species, a CDFG species of special concern, and an MSCP covered species. For the purposes of this report, a 'gnatcatcher location' may represent either an individual or pair of gnatcatchers and in general, represents a probable territory. A total of 26 locations of coastal California gnatcatcher was mapped in PMA 4. For the purposes of this report, a 'gnatcatcher location' may represent either an individual or pair of gnatcatchers. Coastal California gnatcatchers were observed in subunits 4-1a (3 locations), 4-1cE (2 locations), 4-1dS (1 locations), 4-1e (1 location), 4-1f (2 locations), 4-1h (2 locations), 4-2a (2 locations), 4-2b (10 locations), 4-2c (1 locations), and 4-3b (2 locations). Of these mapped locations, only one observation in subunit 4-3b showed evidence of nesting behavior (i.e., carrying nesting material). One active nest with a pair was also observed in the open space south of subunit 4-1e. Subunit 4-2b had the largest number of gnatcatcher locations, occurring approximately every 700 feet throughout the subunit.

Yellow warbler (*Dendroica petechia*). The yellow warbler is a CDFG species of special concern. The yellow warbler was observed in subunits 4-2b and 4-3c. This species is expected to breed in the southern willow scrub habitat.

Yellow-breasted chat (*Icteria virens*). The yellow-breasted chat is a CDFG species of special concern. This species was observed in subunit 4-2b during the focused riparian bird surveys conducted in 2003. Suitable breeding habitat is present in PMA 4 for the yellow-breasted chat.

Southern California rufous-crowned sparrow (*Aimophila ruficeps canescens*)—an MSCP covered species. The southern California rufous-crowned sparrow is a CDFG species of special concern. Southern California rufous-crowned sparrows were observed in subunits 4-1h, 4-2b, and 4-2c, and are expected to occur in the coastal sage scrub throughout PMA 4.

Not Observed

Sharp-shinned hawk (*Accipiter striatus*). This species is a CDFG species of special concern. There is a moderate potential for this winter visitor to forage in the southern willow scrub and eucalyptus woodland in PMA 4.

Golden eagle (*Aquila chrysaetos*). The golden eagle is an MSCP covered species and a CDFG species of special concern. There is a high potential for golden eagles to forage in PMA 4, as a golden eagle was observed foraging over several of the PMA 2 subunits. This species has a low potential to nest on-site; the closest known breeding location is to the northeast, at San Miguel Mountain.

Western burrowing owl (*Athene cunicularia hypugaea*). The western burrowing owl is an MSCP covered species and a CDFG species of special concern. Potential habitat for this species is present in the coastal sage scrub and grassland areas of PMA 4 with existing burrows. This species is not expected to nest in the PMA.

Vaux's swift (*Chaetura vauxi vauxi*). The Vaux's swift is a CDFG species of special concern. Vaux's swift are expected to forage in PMA 4 during migration.

Southwestern willow flycatcher (*Empidonax traillii extimus*). The southwestern willow flycatcher is an MSCP covered species and a state and federally listed endangered species. This species was not observed during the focused surveys conducted in 2003 and is not expected to breed in PMA 4 due to a lack of suitable breeding habitat. The southern willow scrub present is too narrow and does not provide the proper canopy configuration. However, the southwestern willow flycatcher may use the riparian habitat as a migration stop-over area for foraging during spring and fall.

California horned lark (*Eremophila alpestris actia*). The California horned lark is a CDFG species of special concern. There is a moderate potential for this species to occur and breed in the grassland areas of PMA 4.

Loggerhead shrike (*Lanius ludovicianus*). The loggerhead shrike is a CDFG species of special concern. This species has the potential to forage in the sparse coastal sage scrub and grassland areas of PMA 4.

Bell's sage sparrow (*Amphispiza belli belli*). The Bell's sage sparrow is a CDFG species of special concern. This species was not observed during the focused surveys conducted for coastal California gnatcatcher; however, the habitat appears suitable and there is a low potential for this species to colonize areas of scrub or chaparral in PMA 4 in the future.

Grasshopper sparrow (*Ammodramus savannarum*). There is a moderate potential for this species to occur in the grassland habitat in subunits 4-1a, 4-2a, 4-2c, and 4-1g.

Tricolored blackbird (*Agelaius tricolor*). The tricolored blackbird is an MSCP covered species and a CDFG species of special concern. This species has a low potential to occur in PMA 4 due to the lack of freshwater marsh habitat.

Western bluebird (*Sialia mexicana*). The western bluebird is an MSCP covered species. There is a potential for western bluebirds to occur in most PMA 4 habitats during the winter.

4.4.4.5 Sensitive Mammals

One sensitive species, southern mule deer, was observed in PMA 4 and five sensitive species have the potential to occur. These are discussed below.

Observed

Southern mule deer (*Odocoileus hemionus fuliginata*)—an MSCP covered species. Southern mule deer were detected by scat in subunit 4-1g and by track in subunit 4-2b.

Not Observed

San Diego black-tailed jackrabbit (*Lepus californicus bennettii*). The San Diego black-tailed jackrabbit is a CDFG species of special concern. San Diego black-tailed jackrabbits are expected to occur in the grassland and scrub areas of PMA 4.

Northwestern San Diego pocket mouse (*Chaetodipus fallax fallax*). The northwestern San Diego pocket mouse is a CDFG species of special concern. There is a moderate potential for this species to be present in open coastal sage scrub and grassland areas with loose soil.

Southern grasshopper mouse (*Onychomys torridus ramona*). The grasshopper mouse is a CDFG species of special concern. There is a moderate potential for this species to be present in scrub areas with clumps of cactuses.

San Diego desert woodrat (*Neotoma lepida intermedia*). The San Diego desert woodrat is a CDFG species of special concern. There is a moderate potential for this species to be present in the coastal sage scrub and maritime succulent scrub habitat available in PMA 4.

Mountain lion (*Felis concolor*). There is a low potential for mountain lions to occur in PMA 4, based on connectivity to large tracts of open space that connect to San Miguel Mountain (Scott Tremor, pers. comm. 2002). A large mammal scat with the remains of a house cat was detected on subunit 4-1h. A positive identification was not made, however, given the size, shape, and dietary remains, the scat could have been deposited by either a large bobcat or mountain lion. This subunit is located at the edge of the PMA adjacent to a larger expanse of open space near Proctor Valley Road. At the time of detection, this adjacent open space was not yet developed to the extent it is now and it was directly connected to open space large enough to support a mountain lion's home range.

4.4.5 Invasive Exotic Plant Species

The major invasive exotic threats to native plant species in the Center City Preserve Area are annual grasses, including bromes, wild oats, ryegrass, other non-native annual grasses, and black mustard. These species quickly establish populations in disturbed areas and the interface of disturbed areas and native habitat. Annual grasses and black mustard invade native habitats and replace the native herbaceous understory species. At the end of the growing season of these non-natives, they dry out and provide fuel for wildfires.

Other invasive plant species pose a threat to native plant species, habitat structure, and wildlife species populations. These species include pampas grass, star-thistle, sweet fennel, crystalline ice plant, tamarisk hollow-stem asphodel, and filaree.

Figures 11a-11c, 11e-11f, and 11h-11l illustrate the locations of invasive exotic species identified in PMA 4.

4.4.6 Other Survey Results

4.4.6.1 Roadkill

No roadkill was observed along any of the roadways adjacent to the subunits of PMA 4 during any of the surveys conducted.

4.4.6.2 Drainages, Channels, Culverts, and Detention Basins

Figures 11-11m indicate mapped culverts, gabions (structures consisting of rock caged by wire mesh), detention basins, and maintenance access roads in PMA 4. A culvert is at the eastern edge of subunit 4-2a and likely conveys runoff from the adjacent residential development. Culverts connect subunits 4-2a and 4-2b under Canyon Drive. Two gabions and a culvert are in the center of subunit 4-2b. Another gabion and two culverts are in the southeast corner of this subunit along the drainage. A detention basin is in subunit 4-2c at the south end in the southern willow scrub vegetation.

The culverts that connect subunits are constructed to convey minor water flow. They would be large enough for small mammals, amphibians, and reptiles to pass through when dry or nearly dry. Large mammals are not expected to use these culverts as movement corridors.

4.4.6.3 Wildlife Movement Corridor

For the most part, the subunits in PMA 4 are fairly close together, with residential roads separating them. This allows for relatively unimpeded bird species movement between subunits. However, in many instances, the roads that separate subunits likely decrease the number of terrestrially mobile animals that successfully travel from one subunit to another. Certain major roads, Otay Lakes Road, East H Street, Corral Canyon Road, and Telegraph Canyon Road, are not expected to provide significant pedestrian wildlife movement due to traffic volume and/or physical barriers such as cement lane dividers. Figures 11a-11f, 11h-11k, and 11m indicate potential wildlife movement corridors or pathways in PMA 4.

Subunit 4-1a is part of a larger open space area to the north. However, this entire area is surrounded by development that would force terrestrial wildlife species to cross Corral Canyon Road to connect to other open space areas such as San Miguel Mountain north of PMA 4. Subunit 4-1b is part of a canyon that snakes to the west and south where it connects to subunit 4-1cW. Subunits 4-1dN, 4-1dS, 4-1e, 4-1f, 4-1g, and 4-1h abut the open space of San Miguel Mountain. Wildlife can move freely between these areas. Subunits 4-2c and 4-2d are largely isolated by East H Street and Corral Canyon Road. There is an undeveloped utility easement that runs fairly north from subunit 4-2c and connects to the San Miguel Mountain area; however, terrestrial wildlife would have to cross two residential streets to successfully use this corridor. The open space of subunit 4-2a continues to the north for approximately 1,000 feet, where it terminates in developed areas. Open space continues from the southeastern end of this subunit to connect it with subunit 4-3c. A culvert connects the northeastern end of subunit 4-2a with the western end of subunit 4-2b. Small mammals, amphibians, and reptiles may use this culvert to move between these subunits; however, it is unlikely that large mammals would use the culvert.

4.4.6.4 Dumping, Trespassing, and Vagrant Encampments

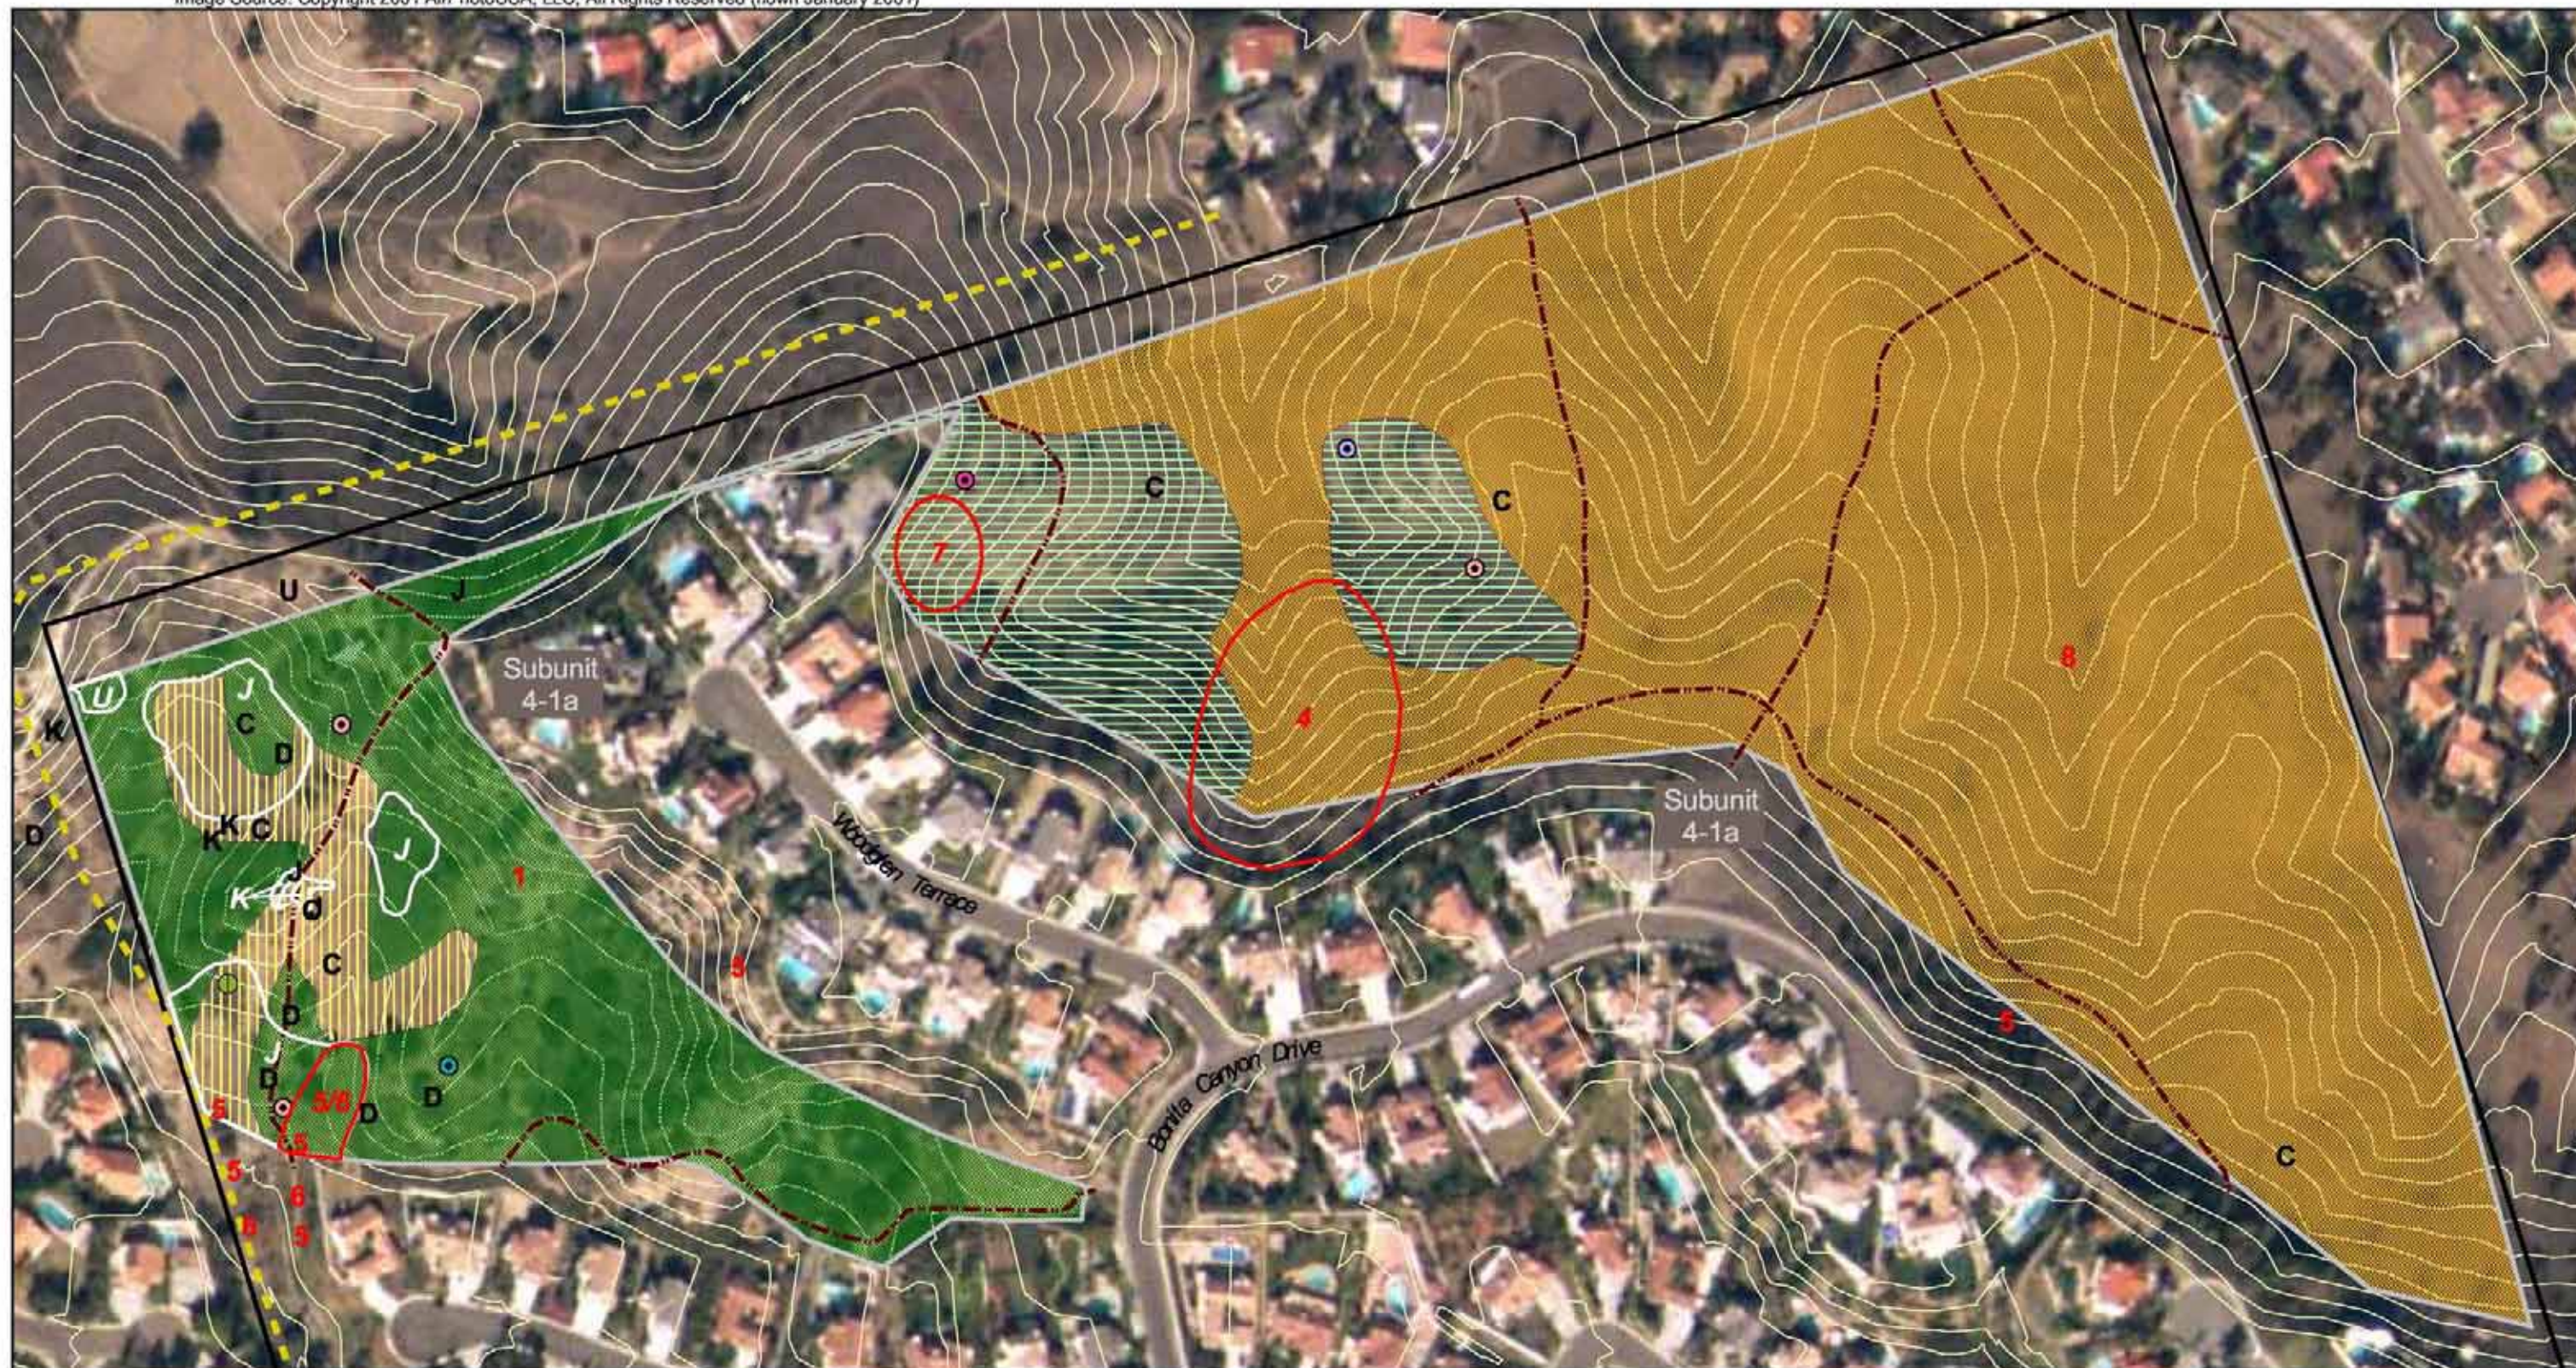

No areas of dumping, trespassing, or vagrant encampments were mapped in PMA 4.

General Vegetation Community Descriptions

Diegan Coastal Sage Scrub (Holland Code 32500)

Diegan coastal sage scrub is a plant community comprised of low-growing, aromatic, drought-deciduous soft-woody shrubs that have an average height of approximately three to four feet. The community typically is found on low moisture-availability sites with steep, xeric slopes or clay rich soils that are slow to release stored water. These sites often include drier south- and west-facing slopes and occasionally north-facing slopes, where the community can act as a successional phase of chaparral development. Diegan coastal sage scrub intergrades at higher elevations with several types of chaparrals. Diegan coastal sage scrub is found in coastal areas from Los Angeles County south into Baja California (Holland 1986).

Maritime Succulent Scrub (Holland Code 32400)

Maritime succulent scrub is a low (two to three feet high), open (25-75 percent cover) vegetation community dominated by drought deciduous, subligneous (somewhat woody), malacophyllous (soft-leaved) shrubs with a rich mixture of stem and leaf succulents. The proportion of cacti is typically highest in inland areas. Ground cover is more or less devoid of vegetation between shrubs. Growth and flowering are concentrated in the spring. Maritime succulent scrub occurs on thin rocky or sandy soils, often on steep slopes of coastal headlands and bluffs. This type of succulent scrub intergrades with southern coastal bluff scrub on more exposed headlands and bluffs and with coastal sage scrub on better developed, moister soils away from the immediate coast (Holland 1986).

Maritime succulent scrub occurs from central San Diego County southward into northern Baja California (Holland 1986). This community type has been greatly reduced by development of coastal sites in the San Diego area.

Southern Willow Scrub (Holland Code 63320)

Southern willow scrub is considered a sensitive wetland habitat by California Department of Fish and Game (CDFG) and U.S. Army Corps of Engineers (USACE). This plant community is typically found along major drainages but also occurs in smaller drainages. The density of the willows (*Salix* spp.) typically prevents a dense understory of smaller plants from growing. The representative species typically grows in loose, sandy, or fine gravelly alluvium deposited near stream channels during flood flows. This community requires repeated flooding to prevent succession to community dominated by sycamores and cottonwoods (Holland 1986).

Attachment 3

General Vegetation Community Descriptions

(continued)

Mule Fat Scrub (Holland Code 63310)

Mule fat scrub is a tall, herbaceous riparian scrub strongly dominated by mule fat (*Baccharis salicifolia*). This is an early successional plant community that occurs along drainages with a fairly coarse substrate and a moderate depth to the water table. Mule fat scrub is developed and maintained from flooding or other disturbance but may develop in the absence of disturbance into willow-cottonwood or sycamore-dominated riparian forest/woodland. Mule fat scrub typically occurs at elevations below 2,000 feet (Holland 1986).

Coastal and Valley Freshwater Marsh (Holland Code 52410)

Coastal and valley freshwater marsh is a plant community considered sensitive by Holland (1986) and the State of California (2003e), and is regulated as a wetland/riparian community by USACE and CDFG. Coastal and valley freshwater marsh is a community that consists of perennial emergent monocots such as cattails and bulrush. Freshwater marsh vegetation occurs in open bodies of freshwater with little current flow, such as ponds, and to a lesser extent around seeps and springs. The vegetation typically forms a closed canopy. Freshwater marshes occur in areas of permanent inundation by freshwater without active streamflow. Freshwater marsh communities, as with all wetland habitats, have been greatly reduced throughout their entire range and continue to decline as a result of urbanization and are considered sensitive by state and federal resource agencies.

Native Grassland (Holland Code 42100)

Native grassland is a vegetation community comprised of native perennial bunch grasses such as needlegrasses (*Nassella* spp.). Native and introduced annuals occur between the perennials, often actually exceeding the bunch grasses in cover. Native grasslands often have a large component of non-native grasses but are distinguished as native grasslands if the percent cover by native grass species is 10 percent or greater. This community usually occurs on fine-textured (often clay) soils, that are moist or even waterlogged during winter, but very dry in summer. In most regions, this vegetation community has been mainly converted to non-native annual grasslands due to the invasion of exotic annual grasses (Holland 1986).

Non-native Grassland (Holland Code 42200)

Non-native grassland is a vegetation community characterized by a dense to sparse cover of annual grasses reaching to three feet high, which may include numerous native wildflowers, particularly in years of high rainfall. Typically, non-native grassland

Attachment 3

General Vegetation Community Descriptions

(continued)

includes at least 50 percent cover of the entire herbaceous layer attributable to annual non-native grass species, although other plant species (native and non-native) may be intermixed. These annuals germinate with the onset of the rainy season and set seeds in the late winter or spring. With a few exceptions, the plants are dead through the summer-fall dry season, persisting as seeds. Non-native grasslands are usually found on fine-textured, usually clay soils, that range from being moist or waterlogged in the winter to being very dry during the summer and fall. Typically, the plant community is found in valleys and foothills throughout most of California (except for the north coastal and desert regions) at elevations below 3,000 to 4,000 feet (Holland 1986).

Tamarisk Scrub (Holland Code 63810)

Tamarisk scrub is dominated by the non-native and highly invasive tamarisk (*Tamarix* spp.). This weedy plant community is usually a monoculture of tamarisk that has supplanted native wetland plant species. Tamarisk usually invades following disturbance. This plant community typically occurs in sandy or gravelly braided washes or intermittent streams, often in areas where high evaporation creates high salinity in the stream (Holland 1986).

Eucalyptus Woodland (Holland Code 11100)

Eucalyptus woodland is dominated by a variety of eucalyptus species. Some species of eucalyptus excrete toxic substances from the roots in order to create conditions that are unfavorable for most other plant species to grow. Because of this allelopathic property of eucalyptus trees, there is a very sparse understory, if any at all, in this type of woodland.

Disturbed (Holland Code 12000)

Disturbed land includes areas that are graded, used recreationally by dirt bike riders, dominated by non-native plants, and contain debris such as cement and trash, and bare soil or patches.

SENSITIVE PLANT SPECIES
OBSERVED (†) OR WITH THE POTENTIAL FOR OCCURRENCE ON PMAs 1-4

Species	State/Federal Status	CNPS List/Code	City of Chula Vista	Typical Habitat/Comments
<i>Acanthomintha ilicifolia</i> † San Diego thornmint	CE/FT	1B/2-3-2	NE,MSCP	Chaparral, coastal sage scrub, valley and foothill grassland/ clay soils. Observed in PMAs 1 and 4. Moderate potential to occur PMA 3.
<i>Achnatherum diegoensis</i> (= <i>Stipa diegoensis</i>) San Diego County needle grass	—/—	4/1-2-1		Rocky soils; chaparral, coastal sage scrub; often near streams. Not observed. Moderate potential to occur in PMA 4.
<i>Adolphia californica</i> † California adolphia	—/—	2/1-3-1		Chaparral. Observed in PMA 4.
<i>Ambrosia chenopodiifolia</i> San Diego bur-sage	—/—	2/3-3-1		Coastal sage scrub. Moderate potential to occur in PMAs 1 and 3. Low potential in PMAs 2 and 4.
<i>Ambrosia pumila</i> San Diego ambrosia	—/FE	1B/3-3-2	NE,MSCP	Coastal sage scrub, valley and foothill grassland. Not observed. Low potential to occur in PMAs 1 and 2.
<i>Artemisia palmeri</i> † San Diego sagewort	—/—	4/1-2-1		Coastal sage scrub, chaparral, riparian. Observed in PMA 2. Moderate potential to occur in PMA 1.
<i>Atriplex pacifica</i> † South Coast saltbush	—/	1B/3-2-2		Coastal bluff scrub, coastal sage scrub. Present in PMAs 1 and 2. Moderate potential to occur in PMA 3. Low potential in PMA 4.
<i>Bergerocactus emoryi</i> † Golden-spined cereus	—/—	2/2-2-1		Coastal sage scrub. Observed in PMAs 2 and 3. Low potential to occur in PMA 1.
<i>Brodiaea orcuttii</i> Orcutt's brodiaea	—/—	1B/1-3-2	MSCP	Valley and foothill grassland, vernal pools. Not observed. Low potential to occur in PMAs 2 and 3.

ATTACHMENT 5
SENSITIVE PLANT SPECIES

(continued)

Species	State/Federal Status	CNPS List/Code	City of Chula Vista	Typical Habitat/Comments
<i>Calandrinia maritima</i> Seaside calandrinia	—/—	4/1-2-1		Coastal bluff scrub, valley and foothill grassland. Not observed. Low potential to occur in PMA 2.
<i>Chorizanthe polygonoides</i> var. <i>longispina</i> Long-spined spineflower	—/—	1B/2-2-2		Annual herb; chaparral, coastal sage scrub, meadows and seeps, valley and foothill grassland, often clay; blooms April–July; elevation less than 4,800 feet. Present in PMAs 1 and 2; potential to occur in PMAs 3 and 4.
<i>Convolvulus simulans</i> Small-flowered morning glory	—/—	4/1-2-2		Annual herb; openings in chaparral, coastal sage scrub, valley and foothill grassland, clay substrate; blooms March–July; elevation less than 2,300 feet. Present in PMAs 1, 3, and, 4. Potential to occur in PMA 2.
<i>Cordylanthus orcuttianus</i> † Orcutt's bird's-beak	—/—	2/3-3-1	MSCP	Coastal sage scrub. Not observed. Present in PMAs 3 and 4. Moderate potential to occur in PMAs 1 and 2.
<i>Cylindropuntia californica</i> (= <i>Opuntia californica</i> var. <i>californica</i>)† Snake cholla	—/—	1B/3-3-2	NE, MSCP	Chaparral, coastal sage scrub. Observed in all PMAs.
<i>Deinandra conjugens</i> (= <i>Hemizonia conjugens</i>)† Otay tarplant	CE/FT	1B/3-3-2	NE, MSCP	Coastal sage scrub. Observed in all PMAs.
<i>Dichondra occidentalis</i> Western dichondra	—/—	4/1-2-1		Chaparral, cismontane woodland, coastal sage scrub, valley and foothill grassland. Not observed. Moderate potential to occur in all PMAs.

FEDERAL CANDIDATES AND LISTED PLANTS

FE = Federally listed, endangered
FT = Federally listed, threatened
FPE = Federally proposed endangered
FPT = Federally proposed threatened

STATE LISTED PLANTS

CE = State listed, endangered
CR = State listed, rare
CT = State listed, threatened

CITY OF CHULA VISTA

NE = Narrow endemic
MSCP = MSCP covered species

CALIFORNIA NATIVE PLANT SOCIETY

LISTS

1A = Species presumed extinct.

1B = Species rare, threatened, or endangered in California and elsewhere. These species are eligible for state listing.

2 = Species rare, threatened, or endangered in California but which are more common elsewhere. These species are eligible for state listing.

3 = Species for which more information is needed. Distribution, endangerment, and/or taxonomic information is needed.

4 = A watch list of species of limited distribution. These species need to be monitored for changes in the status of their populations.

R-E-D CODES

R (Rarity)

1 = Rare, but found in sufficient numbers and distributed widely enough that the potential for extinction is low at this time.

2 = Occurrence confined to several populations or to one extended population.

3 = Occurrence limited to one or a few highly restricted populations, or present in such small numbers that it is seldom reported.

E (Endangerment)

1 = Not endangered
2 = Endangered in a portion of its range
3 = Endangered throughout its range

D (Distribution)

1 = More or less widespread outside California
2 = Rare outside California
3 = Endemic to California

ATTACHMENT 7

Attachment 7

Descriptions of Sensitive Plant Species Observed in the Central City Preserve Management Area

NOTE: *Species are listed in alphabetical order according to their scientific name.*

San Diego thornmint (*Acanthomintha ilicifolia*). San Diego thornmint was state listed as an endangered species in 1982 (State of California 2000), and federally listed as threatened in 1998 (USFWS 1998). It is a narrow endemic species covered under the MSCP, and a CNPS List 1B species. This aromatic annual in the mint family (Lamiaceae) grows to about six inches tall and bares white- and rose-colored flowers in April and May (Munz 1974). San Diego thornmint ranges from San Marcos and Alpine to Otay Mesa in San Diego County, and southward to San Quentin in Baja California (USFWS 1998). It usually occurs in openings in chaparral, coastal sage scrub, and native grassland communities, in or near vernal pools (CNPS 2001). It is restricted to heavy clay soils, either of gabbroic parent material or derived from calcareous marine sediments (USFWS 1998), particularly Las Posas or San Miguel-Exchequer soils (Reiser 2001). It is often found at sites with native spring annuals, bulbiferous perennials, and herbs such as blue dicks (*Sisyrinchium bellum*) (Reiser 2001).

Approximately 30 populations of San Diego thornmint remain in San Diego County and the species is considered to be declining (State of California 2000). More than 15 populations have been extirpated due to urban development along the coastal plain of San Diego County. The remaining 30 natural populations are threatened by urban development, off-highway-vehicle activity, and invasion of non-native species (State of California 2000).

California adolphia (*Adolphia californica*). California adolphia is a CNPS List 2 species (CNPS 2001). This small shrub in the buckthorn family (Rhamnaceae) flowers from December to April and loses its leaves in late summer and fall, making it difficult to find, though its spiny stems are identifiable at close range year-round. This species generally occurs in Diegan coastal sage scrub, near the edge of chaparral, particularly in dry canyons or washes. It is associated with San Miguel and Friant soils (Reiser 2001). Its range is limited to San Diego County and northern Baja California, Mexico at elevations below 1,000 feet. In San Diego County, it is found from the Carlsbad area south into the Proctor Valley and the Otay area (Beauchamp 1986).

San Diego bur-sage (*Ambrosia chenopodifolia*). San Diego bur-sage is a CNPS List 2 species (CNPS 2001). This perennial shrub in the sunflower family (Asteraceae) has hairy grayish leaves and flowers from April to June. Its range is restricted to extreme southern San Diego County, near Otay Mesa, and northern Baja California, Mexico. It is generally found in dry, fairly open, Diegan coastal sage scrub below 600 feet elevation,

Attachment 7

Descriptions of Sensitive Plant Species Observed in the Central City Preserve Management Area

(continued)

where it often grows in association with low-growing California sagebrush and black sage (*Salvia mellifera*). It has been found on Olivenhain cobbly loam soil (Reiser 2001).

San Diego ambrosia (*Ambrosia pumila*). San Diego ambrosia is federally listed as endangered (USFWS 2002), a narrow endemic species under the draft Chula Vista MSCP, and a CNPS List 1B species (CNPS 2001). This perennial herb in the sunflower family (Asteraceae) emerges from rhizomes in spring and flowers from June to September. It is found at elevations below 500 feet in western Riverside and San Diego Counties, and in northern Baja California. It may occur in disturbed areas in chaparral, coastal scrub, grassland, or vernal pool communities (CNPS 2001). Potential habitat in San Diego County is along creek beds, seasonally dry drainages, and floodplains along the edge of willow woodland, in riverwash or sandy alluvial soils (Reiser 2001), from the San Luis Rey River south to the Sweetwater River (Beauchamp 1986).

San Diego sagewort (*Artemisia palmeri*). San Diego sagewort is a CNPS List 4 species. This perennial in the sunflower family (Asteraceae) grows as a series of long wandlike stems from the base and blooms from July to September (Munz 1974). It is found in San Diego County and northern Baja California, Mexico (CNPS 2001). In San Diego County, its distribution ranges from La Jolla south to Otay and east to Alpine (Beauchamp 1986). In coastal areas it occurs mostly near creeks and drainages, where it can occur in low numbers in dense riparian vegetation and may be difficult to detect. Further inland it may occur in mesic chaparral vegetation, such as that found on the north-facing slopes (Reiser 2001).

South coast saltbush (*Atriplex pacifica*). South coast saltbush is a CNPS List 1B species. It is a prostrate annual herb in the goosefoot family (Chenopodiaceae) that forms tangled masses up to three feet in diameter and produces inconspicuous flowers between March and October. This species is distributed coastally from Los Angeles south to Baja California and on the Channel Islands, with disjunct populations in Arizona and Sonora, Mexico (CNPS 2001). It is found below 300 feet elevation, in coastal bluff scrub, coastal dunes, and coastal scrub; it can also occur in alkaline playas in the desert (CNPS 2001). In San Diego County it typically grows in dry, often mildly disturbed sites in open Diegan coastal sage scrub; host soils include Linne clay loam and Huerhuero-urban land (Reiser 2001).

Golden-spined cereus (*Bergerocactus emoryi*). Golden-spined cereus is a CNPS List 2 species (CNPS 2001). This low-growing cactus has cylindrical stems and flowers in May and June. Its distribution extends from San Clemente and Santa Catalina Islands

Attachment 7

Descriptions of Sensitive Plant Species Observed in the Central City Preserve Management Area

(continued)

into San Diego County and south to approximately El Rosario, Baja California, Mexico (Bensen 1969). In San Diego County it is limited to coastal sage and maritime succulent scrub habitats near the coast from Torrey Pines State Park south to the Mexican border (Beauchamp 1986).

Orcutt's brodiaea (*Brodiaea orcuttii*). Orcutt's brodiaea is a CNPS List 1B species and is a Chula Vista MSCP narrow endemic species. This bulbiferous perennial is in the lily family (Liliaceae) and flowers from April through July. Its range is limited to San Diego, Riverside, and Orange Counties and Baja California, Mexico at elevations up to 5,500 feet (Munz 1974). Typically it is found in chaparral and lower montane coniferous forest communities, particularly areas with vernal moist grasslands, mima mounds, or at the edge of vernal pools or streams (Reiser 2001). It is known to occur in clay, and sometimes serpentine, soils including Stockpen gravelly loam on Otay Mesa and Redding gravelly loam on Mira Mesa (Reiser 2001).

Orcutt's bird's-beak (*Cordylanthus orcuttianus*). Orcutt's bird's beak is a CNPS List 2 species and is a species covered under the draft Chula Vista MSCP. This annual is in the snapdragon family (Scrophulariaceae) and flowers from March to July. Its range extends from southern San Diego County into Baja California. Its habitat is coastal scrub below 1,000 feet elevation (Hickman 1993, CNPS 2001), although Reiser (2001) considers seasonally dry drainages and upland adjacent to riparian habitat as its preferred habitat. The largest U.S. population is located in the Otay River drainage.

Otay tarplant (*Deinandra conjugens* [= *Hemizonia conjugens*]). Otay tarplant is listed as a California endangered species (State of California 2000b) and a federal threatened species (USFWS 1998). It is on CNPS List 1B and is a narrow endemic species under the draft Chula Vista MCSP. This small, aromatic annual herb in the sunflower family (Asteraceae) produces mostly solitary yellow flowerheads in May and June (Munz 1974; State of California 2000). It ranges from southwestern San Diego County into Baja California, in open coastal sage scrub and grassland habitats below 1,000 feet (CNPS 2001). It typically occurs in herbaceous plant communities on slopes and mesas with expansive clay soils, and may occur in non-native grasslands and fallow agricultural fields where clay soils are present (Reiser 2001). Residential and commercial development and highway construction have led to the decline of this species (State of California 2000b).

Variegated dudleya (*Dudleya variegata*). Variegated dudleya is a CNPS List 1B species and is a draft Chula Vista MSCP narrow endemic species. This small, drought-

Attachment 7

Descriptions of Sensitive Plant Species Observed in the Central City Preserve Management Area (continued)

deciduous succulent perennial blooms from May to June and ranges from north-central San Diego County southward into northern Baja California to the vicinity of Ensenada. The species can be found in a number of plant community types including coastal sage scrub, maritime succulent scrub, valley grasslands, chaparral, and even in and around vernal pools. The species is typically associated with clay soils. The plants do not require clay soils in order to grow as determined by studies in cultivation, but the expansion and contraction properties of the clay soils they inhabit restrict the growth of shrubby perennials which would easily outcompete a small geophytic plant like variegated dudleya (Doderer 1995). Variegated dudleya was historically more common around the margins of San Diego Bay, but historic localities at Chula Vista and National City have been extirpated. The species is in decline throughout its range due to development and grazing.

Palmer's ericameria (*Ericameria palmeri* var. *palmeri* [= *Haplopappus palmeri* ssp. *palmeri*]). Palmer's ericameria is a CNPS List 2 species and is a Chula Vista MSCP narrow endemic species. This shrub in the sunflower family (Asteraceae) may grow to five feet tall and flowers from September to November. Its range extends from San Diego County south into Baja California; the northernmost occurrence is reported from Carmel Valley with most reports from near Jamul and Jamacha (Reiser 2001). It prefers seasonally moist sites, such as coastal drainages or mesic chaparral, but may occur in coastal sage scrub. It is associated with sandy loam soils (Reiser 2001).

Cliff spurge (*Euphorbia misera*). Cliff spurge is a CNPS List 2 species. Cliff spurge is a shrub in the spurge family (Euphorbiaceae) that grows to about three feet tall and may flower from December to August. It is found coastally from Orange County south to Baja California and in the Channel Islands, with a disjunct population in the Sonoran Desert near Whitewater, Riverside County. It typically occurs in coastal bluff scrub or maritime succulent scrub below 1,700 feet (CNPS 2001). The largest populations in San Diego County are found on Point Loma and Otay Mesa, with occurrences as far north as Carlsbad (Reiser 2001). Soil series associated with this species include Olivenhain cobbly loam and Gaviota fine sandy loam (Reiser 2001). This spiny, low-growing shrub with brittle branches is readily recognizable year-round.

San Diego barrel cactus (*Ferocactus viridescens*). The coast barrel cactus is a CNPS List 2 species. This perennial stem succulent ranges from San Diego County southward into northern Baja California. It is typically found growing around rock outcrops or in cobbles on warm dry slopes or flats with a southerly exposure. It inhabits maritime succulent scrub, coastal sage scrub, valley grassland, chaparral, and is found

Attachment 7

Descriptions of Sensitive Plant Species Observed in the Central City Preserve Management Area (continued)

around the edges of vernal pools. The coast barrel cactus flowers from April through June. Throughout its range, coast barrel cactus is threatened by urbanization, vehicles, and horticultural collecting.

Palmer's grappling hook (*Harpagonella palmeri* var. *palmeri*). Palmer's grappling hook is a CNPS List 4 species. This small herbaceous annual in the borage family (Boraginaceae) flowers from March to May, then produces spiny nutlets that look like tiny grappling hooks. Palmer's grappling hook is found in Los Angeles, Orange, Riverside, and San Diego Counties, Arizona, Baja California, and Sonora, Mexico (CNPS 2001). It may be found in grasslands, coastal sage scrub, and chaparral habitats below 2,700 feet (CNPS 2001), but in San Diego it is typically found in open grassy slopes or open coastal sage scrub habitat on clay soils. The largest population in San Diego County is on Table Mountain near Jacumba, with smaller populations scattered nearer the coast (Reiser 2001). This inconspicuous plant can most reliably be identified in late spring or early summer when its distinctive fruit can be observed.

Graceful tarplant (*Holocarpha virgata* ssp. *elongata*). Graceful tarplant is a CNPS List 4 species. This strongly aromatic, sticky, annual herb in the sunflower family (Asteraceae) has a slender stem that may grow to four feet tall and flowers from July to November. It occurs in Orange, Riverside and San Diego Counties. Graceful tarplant may occur in coastal sage scrub and cismontane woodland (CNPS 2001), but is most commonly found in grasslands below 2500 feet (Hickman 1993). Usually there is little shrub cover where graceful tarplant is found, but non-native grasses and herbs may dominate the area (Reiser 2001).

Decumbent goldenbush (*Isocoma menziesii* [= *Isocoma menziesii* var. *decumbens*]). Decumbent goldenbush is a CNPS List 1B species. This is a low, spreading shrub in the sunflower family (Asteraceae) that blooms between April and November (Munz 1974). This variety is found in the Channel Islands, Orange and San Diego Counties, and in Baja California (CNPS 2001). Decumbent goldenbush grows in dry sandy mesas in coastal sage scrub (Munz 1974) intermixed with grassland. In San Diego County, this variety is concentrated in the vicinity of Bonita northward to the Marine Corps Air Station Miramar, but has been reported as far south as Otay Mesa and as far north as Carlsbad (Reiser 2001).

Decumbent goldenbush can be distinguished by being a relatively short shrub, with grayish leaves with cobwebby hairs that typically have a few (but variable in number) shallow teeth on the tip (Nesom 1991, cited in Reiser 2001). Munz (1974) differentiates

Attachment 7

Descriptions of Sensitive Plant Species Observed in the Central City Preserve Management Area (continued)

decumbent goldenbush as having few flower heads, with almost simple, compact, and rounded flower clusters (rather than open panicles), and with leaves mostly 0.4 to 1.2 inches long (rather than 1.2 to 2 inches long).

San Diego marsh elder (*Iva hayesiana*). San Diego marsh elder is a CNPS List 2 species. This plant is a subshrub with multiple stems and relatively fleshy leaves that grows to three feet tall and produces nodding clusters of inconspicuous flowers between April and September (Munz 1974). This species is distributed in San Diego County and northern Baja California below 1,700 feet. Its habitat is identified as marshes, swamps, and playas (CNPS 2001), alkaline sinks and flats (Munz 1974; Hickman 1993) and creeks of intermittent streambeds (Reiser 2001). In San Diego County, it has been reported from the Tijuana Estuary to near Lake Hodges, with populations becoming smaller and more localized in the northern part of its range. San Diego marsh elder is found on sandy alluvial embankments with cobbles on San Miguel-Exchequer, Huerhuero loam, or riverwash soils (Reiser 2001).

Spiny rush (*Juncus acutus* ssp. *leopoldii*). Southwestern spiny rush is a CNPS List 4 species. It ranges from central California to northern Baja California. This large rhizomatous perennial herb is typically found around mesic coastal dunes, alkaline seeps, and coastal salt marshes. Spiny rush flowers from May to June (Munz 1974). Threats to this species include urbanization and flood control projects.

San Diego sand aster (*Lessingia filaginifolia* var. *filaginifolia* [= *Corethrogyne filaginifolia* var. *incana*]). San Diego sand aster is a CNPS List 1B species. This perennial herbaceous subshrub in the sunflower family (Asteraceae) grows from 20 to 32 inches tall and flowers from June to August (Munz 1974). The range of San Diego sand aster is limited to San Diego County and Baja California; in San Diego has been reported near the coast between Carmel Mountain and the Tijuana Estuary (State of California 2003e). This variety commonly occurs on sandy slopes facing the sea (Munz 1974) but may occur in chaparral, coastal bluff scrub, and coastal sage scrub below 400 feet elevation (CNPS 2001). The largest population, on Point Loma, occurs in sandy openings between chamise in coastal chaparral on Carlsbad gravelly loamy sand and Gaviota fine sandy loam soils (Reiser 2001).

San Diego sand aster has been taxonomically included within California aster (*Lessingia filaginifolia* var. *filaginifolia*) along with what used to be considered separate varieties in the genus *Corethrogyne* (Hickman 1993). The ranges of two of these varieties, Del Mar sand aster (*C. f.* var. *linifolia*) and virgate cudweed aster (*C. f.* var. *virgata*), overlap that

Attachment 7

Descriptions of Sensitive Plant Species Observed in the Central City Preserve Management Area

(continued)

of San Diego sand aster (Beauchamp 1986). These varieties may be distinguished by growth form: San Diego sand aster has stout stems from 20 to 32 inches tall; Del Mar sand aster grows to only 16 inches; virgate cudweed aster is slender and may grow from 16 inches to four feet tall. Floral characters are more definitive in distinguishing these varieties: San Diego sand aster has bracts below the flowers (involucres) that are over 0.4 inch long that are hemispherical, with long-stalked glands; the involucres of virgate cudweed-aster are less than one-third inch long and have short glands; the involucres of Del Mar sand aster are covered with short, white woolly hairs (Munz 1974).

San Diego goldenstar (*Muilla clevelandii*). San Diego goldenstar is a CNPS List 1B species and a draft Chula Vista MSCP covered species. This herbaceous perennial in the lily family (Liliaceae) grows to one foot tall and has bright yellow flowers in May (Munz 1974). San Diego goldenstar is found below 1,500 feet in southwestern San Diego County and northern Baja California, Mexico. It grows in grasslands and vernal pool habitats and on the edges of coastal sage scrub and chaparral. While typically found in clay soils, it may also occur in fine sandy loam on mounds between vernal pools (State of California 2002a).

Spreading navarretia (*Navarretia fossalis*). Spreading navarretia is listed as threatened by the USFWS (1998), is a CNPS List 1B species, and is a covered species under the draft Chula Vista MSCP. This low-growing annual herb in the phlox family (Polemoniacae) grows to about five inches tall and flowers from April to June. Its range includes northwestern Los Angeles County, western Riverside County, coastal San Diego County, and northwestern Baja California (USFWS 1998); it is presumed extirpated from San Luis Obispo County (CNPS 2001). This species occurs in vernal pools and ditches below 4,300 feet above mean sea level (Hickman 1993).

Small-flowered morning glory (*Convolvulus simulans*). Small-flowered morning glory is a CNPS (2001) List 4 species. This small annual in the morning-glory family (Convolvulaceae) grows from four inches to two feet tall and has small pinkish or bluish bell-shaped flowers from March to May (Munz 1974). Its range is cismontane, extending south from Contra Costa and Stanislaus Counties to Baja California, Mexico. Small-flowered morning glory is found in openings in chaparral, coastal sage scrub and grasslands habitats. It is associated with friable or wet clay, serpentine, or ultramafic soils and occurs on ridges or in seeps below 2300 feet (Munz 1974, Hickman 1993, CNPS 2001). This plant, the only species of morning-glory native to California, does not climb but is diffusely branched.

Attachment 7

Descriptions of Sensitive Plant Species Observed in the Central City Preserve Management Area (continued)

Long-spined spineflower (*Chorizanthe polygonoides* var. *longispina*). Long-spined spineflower is a CNPS (2001) List 1B species. This low-growing, reddish annual herb in the buckwheat family (Polygonaceae) blooms from April to July (Munz 1974). Long-spined spineflower is known from Santa Barbara, western Riverside, and western San Diego Counties and Baja California (CNPS 2001). In San Diego County, long-spined spineflower ranges from Cuyamaca Lake west to the coast, with a substantial population on Kearny Mesa. It is typically found in open clay lenses in chaparral and coastal sage scrub habitats and near vernal moist habitats, particularly vernal pools and seeps. It has been noted growing on Boomer stony loam and Redding gravelly loam soils (Reiser 2001). In order to distinguish this plant from other spineflowers, it is necessary to examine the flower parts, so surveys for this species must be conducted in late spring or summer.

Snake cholla (*Cylindropuntia californica* var. *californica* [= *Opuntia californica* var. *californica*]). Snake cholla is a CNPS List 1B species and a narrow endemic species under the MSCP. It is a generally prostrate cactus (Cactaceae family) that may grow up to nine feet and blooms with yellow or green-yellow flowers in April and May. This variety grows only in southern San Diego County and Baja California, with the northernmost known location in Florida Canyon in Balboa Park (Reiser 2001). Snake cholla occurs in coastal sage scrub and chaparral habitats between 100 and 500 feet elevation (CNPS 2001), most often on dry hillsides. It is associated with Huerhuero loam, Gaviota fine sandy loam, and Redding cobbly loam soils (Reiser 2001). This variety can be distinguished from *O. parryi* var. *parryi* by its range, prostrate growth habit, shorter tubercle, and absence of a longer central spine (Reiser 2001).

Otay mesa mint (*Pogogyne nudiuscula*). Otay mesa mint is state listed (State of California 2000) and federally listed as an endangered species (USFWS 1993). It is a CNPS List 1B species and is a MSCP covered species. This aromatic annual herb in the mint family (Lamiaceae) may grow to one foot tall and produces bright purple flowers in May and June (Munz 1974). This species' range is now limited to Otay Mesa in southern San Diego County; populations reported in Balboa Park, University Heights, and Mission Valley were lost to urbanization (State of California 2000), and those reported in the Del Mar, La Jolla, and Point Loma topographic USGS 7.5-minute quadrangles and in northern Baja California have been extirpated (CNPS 2001). Otay mesa mint occurs in vernal pools in grassland and chamise chaparral habitat with mima mound topography, usually on Stockpen gravelly clay loam soil. Otay mesa mint can be distinguished from the related San Diego mesa mint (*P. abramsii*) by its straighter, stouter stems, lack of hairs (generally), and wider (four to eight inches) inflorescence (Hickman 1993).

Attachment 7

Descriptions of Sensitive Plant Species Observed in the Central City Preserve Management Area

(continued)

Otay mesa mint is considered to be declining. Urbanization, livestock grazing, agricultural conversion, and activities associated with the border crossing with Mexico threaten the species (State of California 2000).

Nuttall's scrub oak (*Quercus dumosa*). Nuttall's scrub oak is a CNPS List 1B species. This evergreen shrub in the oak family (Fagaceae) grows to less than 10 feet tall and blooms from February to April. This species is found near the coast in Santa Barbara, Orange, and San Diego Counties and in Baja California, Mexico at elevations below 1,300 feet. It grows in chaparral, coastal sage scrub, and closed-cone coniferous forest habitats (CNPS 2001), preferring coastal chaparral with a relatively open canopy in flat areas, but growing in dense stands on north-facing slopes (Reiser 2001). In San Diego County it is known to grow as far inland as Camp Elliott and Otay Mesa (Reiser 2001), being replaced by the similar scrub oak, *Q. berberidifolia*, in higher, drier locations (Hickman 1993). Nuttall's scrub oaks can be distinguished from the scrub oak, with which it may hybridize, by its acorn, which is less than 0.4 inch wide, moderately tubercled, with a thin cup (Hickman 1993), and by its leaves, which tend to be smaller, spinier, and more undulated (Reiser 2001) and have densely matted gray hairs (Roberts 1995).

Munz's sage (*Salvia munzii*). Munz's sage is a CNPS List 2 species. This aromatic shrub in the mint family (Lamiaceae) grows up to eight feet tall and produces dark blue flowers from February to April. The range of this species is restricted to southwestern San Diego County and adjacent Baja California, Mexico. It is found in coastal sage scrub and lower chaparral habitats below 2,500 feet. It is dominant or common in sage scrub near Lower Otay Lake, San Miguel Mountain, and Jamul Mountain and is relatively common in northern Baja California (Reiser 2001). Munz's sage is similar to black sage, but has darker flowers in smaller clusters (about one-half-inch wide) and a different aroma (Reiser 2001).

San Diego County viguiera (*Viguiera laciniata*). San Diego County viguiera is a CNPS (2001) List 4 species. This shrub in the sunflower family (Asteraceae) has shiny, resinous leaves and showy yellow flowers that bloom from February to June (Hickman 1993, Munz 1974). Its range extends from Sonora and Baja California, Mexico northward into San Diego and Orange County (CNPS 2001), although the population in Orange County may not be native (Reiser 2001). In San Diego County it is rare north of Highway 78, becoming increasingly common to the south, until it is the dominant coastal sage shrub in non-coastal southern San Diego County (Reiser 2001). San Diego County viguiera

Attachment 7
Descriptions of Sensitive Plant Species Observed in the Central
City Preserve Management Area
(continued)

occurs on dry, shrubby slopes in Diegan coastal sage scrub and chaparral habitats between 200 and 2,500 feet.

Status

- BEPA = Bald and Golden Eagle Protection Act
 CFP = California fully protected species
 CSC = California Department of Fish and Game species of special concern
 FE = Listed as endangered by the federal government
 FT = Listed as threatened by the federal government
 MSCP = Multiple Species Conservation Program target species list
 ST = Listed as threatened by the state of California
 * = Taxa listed with an asterisk fall into one or more of the following categories:
- Taxa considered endangered or rare under Section 15380(d) of CEQA guidelines
 - Taxa that are biologically rare, very restricted in distribution, or declining throughout their range
 - Population(s) in California that may be peripheral to the major portion of a taxon's range, but which are threatened with extirpation within California
 - Taxa closely associated with a habitat that is declining in California at an alarming rate (e.g., wetlands, riparian, old growth forests, desert aquatic systems, native grasslands)

ATTACHMENT 9

ATTACHMENT 9
SENSITIVE WILDLIFE SPECIES KNOWN (†) OR POTENTIALLY OCCURRING ON PMAs 1-4

Species	Status	Habitat	Occurrence PMA/Comments
<u>Invertebrates</u> (Nomenclature from Mattoni 1990 and Opler and Wright 1999)			
Quino checkerspot butterfly <i>Euphydryas editha quino</i>	FE	Open, dry areas in foothills, mesas, lake margins. Larval host plant <i>Plantago erecta</i> .	Adult emergence mid-January through April. Not observed. No historical observations. Low potential to occur in PMAs 3 and 4, which are partially within the QCB recovery area (2000) and QCB survey area (2002).
<u>Amphibians</u> (Nomenclature from Crother 2001)			
Western spadefoot <i>Spea hammondi</i>	CSC	Vernal pools, floodplains, and alkali flats within areas of open vegetation.	Not observed. Not expected to occur, low potential in PMA 2, given historical presence of vernal pool habitat.
<u>Reptiles</u> (Nomenclature from Crother 2001 and Crother et al. 2003)			
Coronado skink <i>Eumeces skiltonianus interparietalis</i>	CSC	Grasslands, open woodlands and forest, broken chaparral. Rocky habitats near streams.	Not observed. Moderate potential in all PMAs.
Belding's orangethroated whiptail† <i>Aspidoscelis (=Cnemidophorus) hyperythrus beldingi</i>	CSC, MSCP	Chaparral, coastal sage scrub with coarse sandy soils and scattered brush.	Observed in all PMAs.
San Diego horned lizard† <i>Phrynosoma coronatum blainvillii</i>	CSC, MSCP, *	Chaparral, coastal sage scrub with fine, loose soil. Partially dependent on harvester ants for forage.	Observed in PMAs 1, 2, and 4. Moderate potential in PMA 3.
Coastal western whiptail <i>Cnemidophorus tigris multiscutatus</i>	*	Chaparral, coastal sage scrub, woodlands and near streams.	Not observed. Historical presence in PMA 3. Moderate potential in all PMAs.

ATTACHMENT 9
SENSITIVE WILDLIFE SPECIES KNOWN (†) (OR POTENTIALLY OCCURRING) ON PMAs 1-4
(continued)

Species	Status	Habitat	Occurrence PMA/Comments
Silvery legless lizard <i>Anniella pulchra pulchra</i>	CSC	Herbaceous layers with loose soil in coastal scrub, chaparral, and open riparian. Prefers dunes and sandy washes near moist soil.	Not observed. Moderate potential in all PMAs.
Coast patch-nosed snake <i>Salvadora hexalepis virgulata</i>	CSC	Grasslands, chaparral, sagebrush, desert scrub. Found in sandy and rocky areas.	Not observed. Moderate potential in all PMAs.
Two-striped garter snake <i>Thamnophis hammondi</i>	CSC, *	Permanent freshwater streams with rocky bottoms. Mesic areas.	Not observed. Moderate potential in all PMAs.
Red diamond rattlesnake† <i>Crotalus exsul</i>	CSC	Desert scrub and riparian, coastal sage scrub, open chaparral, grassland, and agricultural fields.	Observed in PMAs 1 and 4. Moderate potential in PMAs 2 and 3.
<u>Birds</u> (Nomenclature from American Ornithologists' Union 1988 and Unitt 1984)			
Double-crested cormorant (rookery site)† <i>Phalacrocorax auritus albociliatus</i>	CSC	Bays, lagoons, estuaries. Not a southern California coastal breeder (Garrett and Dunn 1981). Non-breeding individuals can be present year-round.	Observed flying over PMA 4. No suitable habitat exists for this species to nest or breed here.
Great blue heron (rookery site)† <i>Ardea herodias</i>	*	Bays, lagoons, ponds, lakes. Some localized breeding. Non-breeding individuals can be present year-round.	Observed in PMAs 1 and 2. No rookeries observed. Roosting habitat potentially present in tall riparian and eucalyptus trees.
Great egret (rookery site)† <i>Ardea alba</i>	*	Lagoons, bays, estuaries. Ponds and lakes in the coastal lowland. Winter visitor, uncommon in summer.	Observed in PMA 3 No rookeries observed. Roosting habitat potentially present in tall riparian and eucalyptus trees.

ATTACHMENT 9
SENSITIVE WILDLIFE SPECIES KNOWN (†) (OR POTENTIALLY OCCURRING) ON PMAs 1-4
(continued)

Species	Status	Habitat	Occurrence PMA/Comments
Black-crowned night heron (rookery site)† <i>Nycticorax nycticorax</i>	*	Lagoons, estuaries, bayshores, ponds, and lakes. Often roost in trees. Non-breeding individuals can be present year-round. Localized breeding.	Observed in PMA 1. No rookeries observed. Roosting habitat potentially present.
White-tailed kite (nesting)† <i>Elanus leucurus</i>	CFP, *	Nest in riparian woodland, oaks, sycamores. Forage in open, grassy areas. Year-round resident.	Observed in PMA 2. Potential foraging and nesting habitat in all PMAs, especially in Long Canyon and Rice Canyon.
Northern harrier (nesting)† <i>Circus cyaneus</i>	CSC, MSCP	Coastal lowland, marshes, grassland, agricultural fields. Migrant and winter resident, rare summer resident.	Observed in PMAs 2. Foraging habitat in all PMAs. Nesting habitat is potentially present in some of the larger drainages in PMAs 1, 3, and 4.
Sharp-shinned hawk (nesting)† <i>Accipiter striatus</i>	CSC	Open deciduous woodlands, forests, edges, parks, residential areas. Migrant and winter visitor.	Observed in PMAs 1 and 2. Foraging habitat on all PMAs. Not expected to nest in the area.
Cooper's hawk (nesting)† <i>Accipiter cooperi</i>	CSC, MSCP	Mature forest, open woodlands, wood edges, river groves. Parks and residential areas. Migrant and winter visitor.	Observed in PMAs 1, 2, and 4. Foraging habitat on all PMAs. Potential breeding habitat in all PMAs.
Swainson's hawk (nesting)† <i>Buteo swainsoni</i>	ST, MSCP	Plains, range, open hills, sparse trees. Uncommon spring migrant.	Local breeding population now extirpated. Observed in PMAs 1 and 4. Foraging habitat in all PMAs.
Golden eagle (nesting and wintering)† <i>Aquila chrysaetos</i>	CSC, CFP, BEPA, MSCP	Require vast foraging areas in grassland, broken chaparral, or sage scrub. Nest primarily in cliffs and boulders. Uncommon resident.	Observed in PMA 2. Foraging habitat in all PMAs. San Miguel Mountain is the closest known breeding location. Potential foraging habitat in all PMAs.

ATTACHMENT 9
SENSITIVE WILDLIFE SPECIES KNOWN (†) (OR POTENTIALLY OCCURRING) ON PMAs 1-4
(continued)

Species	Status	Habitat	Occurrence PMA/Comments
American peregrine falcon <i>Falco peregrinus</i>	SE, CFP, MSCP, *	Open coastal areas, mud flats. Rare inland. Rare fall and winter visitor, rare and localized breeding resident.	Observed in PMA 4. Moderate potential to occur in all PMAs.
Western burrowing owl (burrow sites) <i>Speotyto cunicularia hypugaea</i>	CSC, MSCP	Grassland, agricultural land, coastal dunes. Require rodent burrows. Declining resident.	Low potential to occur in open space scrub and grassland areas with existing burrows.
Vaux's swift† <i>Chaetura vauxi</i>	CSC	All habitat types of San Diego County during migration.	Observed in PMA 1. Fall migrant, expected to occur in all PMAs during migration only.
Willow flycatcher <i>Empidonax traillii</i>	SE	Nesting restricted to willow thickets. Also occupies other woodlands. Rare spring and fall migrant, rare summer resident. Extremely localized breeding.	One individual observed in PMA 1, likely a migrant using site as a stop-over to forage. Not expected to nest.
Southwestern willow flycatcher <i>Empidonax traillii extimus</i>	FE, SE, MSCP	Nesting restricted to willow thickets. Also occupies other woodlands. Rare spring and fall migrant, rare summer resident. Extremely localized breeding.	Not observed. No suitable breeding habitat.
California horned lark <i>Eremophila alpestris actia</i>	CSC	Sandy shores, mesas, disturbed areas, grasslands, agricultural lands, sparse creosote bush scrub.	Not observed. Moderate potential to occur in all PMAs. Potential breeding habitat in grasslands on all PMAs.
Loggerhead shrike <i>Lanius ludovicianus</i>	CSC	Open foraging areas near scattered bushes and low trees.	Not observed, but expected to occur. Suitable foraging and breeding habitat occurs in all PMAs.

ATTACHMENT 9
SENSITIVE WILDLIFE SPECIES KNOWN (†) (OR POTENTIALLY OCCURRING) ON PMAs 1-4
(continued)

Species	Status	Habitat	Occurrence PMA/Comments
Least Bell's vireo† <i>Vireo bellii pusillus</i>	FE, SE, MSCP	Willow riparian woodlands. Summer resident.	Present in PMA 4. Low to moderate potential breeding habitat in PMAs 1, 2, and 3, within major drainages.
Coastal cactus wren† <i>Campylorhynchus brunneicapillus couesi</i>	CSC, MSCP, *	Maritime succulent scrub, coastal sage scrub with <i>Opuntia</i> thickets. Rare localized resident.	Observed in PMAs 1, 2, and 4. Potential to occur in areas with cactus thickets.
Coastal California gnatcatcher† <i>Polioptila californica californica</i>	FT, CSC, MSCP	Coastal sage scrub, maritime succulent scrub. Resident.	Observed in all PMAs. Suitable nesting habitat in all PMAs.
Lawrence's goldfinch <i>Carduelis lawrencei</i>	*	Common migrant, rare summer resident.	Observed in PMA 1. Potential to use all PMAs as foraging stop-overs during migration.
Yellow warbler (nesting)† <i>Dendroica petechia brewsteri</i>	CSC	Breeding restricted to riparian woodland. Spring and fall migrant, localized summer resident, rare winter visitor.	Present and expected to breed in all PMAs.
Yellow-breasted chat (nesting)† <i>Icteria virens</i>	CSC	Nests in riparian scrub/woodland. Localized summer resident.	Present and expected to breed in PMAs 2 and 4. Potential breeding/nesting habitat in all PMAs.
Southern California rufous-crowned sparrow† <i>Aimophila ruficeps canescens</i>	CSC, MSCP	Coastal sage scrub, chaparral, grassland. Resident.	Observed in all PMAs. Potential breeding/nesting habitat in all PMAs.
Bell's sage sparrow <i>Amphispiza belli belli</i>	CSC	Chaparral, coastal sage scrub. Localized resident.	Not observed. Moderate potential to occur in all PMAs.
Grasshopper sparrow (nesting) <i>Ammodramus savannarum</i>		Tall grass areas. Localized summer resident, rare in winter.	Not observed. Historically observed in PMAs 2 and 3. Moderate potential to occur in grasslands on all PMAs.

ATTACHMENT 9
SENSITIVE WILDLIFE SPECIES KNOWN (†) (OR POTENTIALLY OCCURRING) ON PMAs 1-4
(continued)

Species	Status	Habitat	Occurrence PMA/Comments
Tricolored blackbird <i>Agelaius tricolor</i>	CSC, MSCP	Freshwater marshes, agricultural areas, lakeshores, parks. Localized resident.	Not observed. Foraging habitat in all PMAs. Low potential to breed in PMAs 1-4.
Western bluebird <i>Sialia mexicana</i>	MSCP	Open woodlands, farmlands, orchards.	Not observed. Possible winter migrant in all PMAs.
<u>Mammals</u> (Nomenclature from Jones et al. 1997 and Hall 1981)			
San Diego black-tailed jackrabbit <i>Lepus californicus bennettii</i>	CSC	Open areas of scrub, grasslands, agricultural fields.	Not observed, but expected to occur. Suitable habitat occurs in all PMAs.
Northwestern San Diego pocket mouse <i>Chaetodipus fallax fallax</i>	CSC	San Diego County west of mountains in sandy herbaceous areas, usually in association with rocks or coarse gravel. Can be found in coastal sage scrub, chaparral, or grasslands.	Not observed.
Southern grasshopper mouse <i>Onychomys torridus Ramona</i>	CSC	Alkali desert scrub & desert scrub preferred. Can also occur in succulent shrub, wash, & riparian areas; coastal sage scrub, mixed chaparral, sagebrush, low sage, and bitterbrush. Low to moderate shrub cover preferred.	Not observed. Low potential to occur in all PMAs.
San Diego desert woodrat <i>Neotoma lepida intermedia</i>	CSC	Coastal sage scrub and chaparral.	Not observed. Moderate potential to occur in all PMAs.
Mountain lion <i>Felis concolor</i>	CFP, MSCP	Many habitats.	Not observed. Low potential to occur in PMA 4.

ATTACHMENT 9
SENSITIVE WILDLIFE SPECIES KNOWN (†) (OR POTENTIALLY OCCURRING) ON PMAs 1-4
(continued)

Species	Status	Habitat	Occurrence PMA/Comments
Southern mule deer† <i>Odocoileus hemionus fuliginata</i>	MSCP	Many habitats.	Observed in PMAs 1, 2, and 4. Moderate to High potential to occur in PMA 3.

Listed/Proposed

- FE = Listed as endangered by the federal government
 FT = Listed as threatened by the federal government
 SE = Listed as endangered by the state of California
 ST = Listed as threatened by the state of California

Other

- BEPA = Bald and Golden Eagle Protection Act
 CFP = California fully protected species
 CSC = California Department of Fish and Game species of special concern
 MSCP = City of Chula Vista draft MSCP Subarea Plan covered species
 * = Taxa listed with an asterisk fall into one or more of the following categories:
- Taxa considered endangered or rare under Section 15380(d) of CEQA guidelines
 - Taxa that are biologically rare, very restricted in distribution, or declining throughout their range
 - Population(s) in California that may be peripheral to the major portion of a taxon's range, but which are threatened with extirpation within California
 - Taxa closely associated with a habitat that is declining in California at an alarming rate (e.g., wetlands, riparian, old growth forests, desert aquatic systems, native grasslands)

ATTACHMENT 10

Attachment 10

Sensitive Wildlife Species Descriptions

Species are listed in alphabetical order according to their scientific name within each major class listed below. Classes include amphibians, reptiles, birds and mammals.

Sensitive Amphibians

Western spadefoot (*Spea hammondi*). The western spadefoot toad is a CDFG species of special concern. This species ranges from central northern California, through the Coast Ranges from San Francisco, and south into Baja California, Mexico at elevations from sea level to 4,500 feet (Stebbins 1985; Zeiner et. al 1988). Habitat for the western spadefoot includes lowlands; washes, floodplains of rivers, alluvial fans, alkali flats, temporary ponds, and vernal pools. Although this species is generally found in areas of open vegetation with sandy or gravelly soil (Stebbins 1985), it has been observed in vernal pools containing clay soils on Otay Mesa. Surface activity can occur from October through April depending on rainfall and oviposition occurs between February and May (Jennings and Hayes 1994). The western spadefoot diet consists of crickets, butterflies, ants, flies, and earthworms (Jennings and Hayes 1994). Decline in western spadefoot populations is primarily due to habitat loss and fragmentation and possibly pesticide use.

Sensitive Reptiles

Silvery legless lizard (*Anniella pulchra pulchra*). The silvery legless lizard is a CDFG species of special concern. This species ranges from Contra Costa County south along the Coast-Transverse and Peninsular ranges into Baja California, Mexico. The silvery legless lizard occupies leaf litter and loose soil in coastal scrub, chaparral, and open riparian habitats. Sandy washes and beach dunes are used for burrowing, and logs and leaf litter for cover and feeding. The silvery legless lizard is insectivorous and their diet consists of larval insects, adult beetles, termites, and spiders. This nocturnal lizard is susceptible to drying and must be in or near moist soil. Breeding occurs between early spring and July. The use of pesticides on agricultural fields has decimated some populations of this lizard.

Belding's orange-throated whiptail (*Cnemidophorus hyperythrus beldingi*). Belding's orange-throated whiptail is a CDFG species of special concern and an MSCP covered species. This lizard occurs from southwestern San Bernardino County south into Baja California. It inhabits washes and other sandy areas where there are rocks and patches of brush. Belding's orange-throated whiptail frequents areas of open coastal sage scrub, chaparral, and streamside growth with loose sandy soils (Stebbins 1985). Belding's orange-throated whiptails feed primarily on insects such as termites (*Reticulitermes* sp.).

Attachment 10

Sensitive Wildlife Species Descriptions

(continued)

The decline of this species is attributed to the loss of coastal sage scrub in southern California coupled with the species' limited range.

Coastal western whiptail (*Cnemidophorus tigris multiscutatus*). The coastal subspecies of the western whiptail has no official state or federal status but was formerly a federal candidate for listing and is still considered locally sensitive. The coastal western whiptail ranges from Santa Barbara County south into western Baja California, Mexico, predominantly on the coastal slope. Habitat consists of coastal sage scrub and chaparral communities, woodlands, and stream sides where plants are sparsely distributed (Stebbins 1985). Its diet consists of insects, spiders, scorpions, and other lizards. The decline of populations of coastal western whiptail is also attributed to habitat loss and fragmentation.

Red diamond rattlesnake (*Crotalus exsul*). The red diamond rattlesnake is a CDFG species of special concern. This species occurs on both sides of the Peninsular Ranges of southwestern California from San Bernardino County south to Baja California, Mexico. Red diamond rattlesnakes inhabit coastal sage scrub, desert scrub, open chaparral, woodland, and grassland habitats, with a preference for rock outcrops as well as agricultural fields from sea level to 4,000 feet (Stebbins 1985). Red diamond rattlesnakes are active year-round with peak activity occurring in April and May (Jennings and Hayes 1994). Breeding occurs from February through September. Their diet consists principally of small mammals, lizards, birds, and other snakes. Population declines of the red diamond rattlesnake are generally attributable to a reduction of habitat in the snakes restricted range due to urbanization and agriculture.

Coronado skink (*Eumeces skiltonianus interparietalis*). The Coronado skink is a CDFG species of special concern. The Coronado skink ranges from central Riverside County south to Baja California, Mexico (Jennings and Hayes 1994). In San Diego County, the Coronado skink is found in a variety of plant communities including grassland, open woodland, forest, and broken chaparral habitats, and is often associated with mesic areas. The Coronado skink is diurnal and most active during from early spring until fall; breeding occurs in June or July (Zweifel 1952, Jennings and Hayes 1994). The diet of the Coronado skink consists of moths, beetles, crickets, grasshoppers, and leaf hoppers. This species is threatened by habitat loss and fragmentation resulting from urbanization and agriculture.

Attachment 10

Sensitive Wildlife Species Descriptions (continued)

San Diego horned lizard (*Phrynosoma coronatum blainvillii*). The San Diego horned lizard is a CDFG species of special concern and an MSCP covered species. This lizard ranges from coastal southern California to the desert foothills and into Baja California. In San Diego County, it has a wide range but spotty distribution. It is often associated with coastal sage scrub, especially areas of level to gently sloping ground, with well-drained loose or sandy soil (Mills 1991). This animal usually avoids dense vegetation, preferring 20 to 40 percent bare ground in its habitat. Populations along the coast and inland have been severely reduced by loss of habitat. Where it can be found, the San Diego horned lizard can be locally abundant, with densities near 20 adults per acre. They are largely dependent upon native harvester ants for food. Adults are active from late March to late August; young are active from August to November or December.

Coast patch-nosed snake (*Salvadora hexalepis virgultea*). The coast patch-nosed snake is a CDFG species of special concern. This species occurs in coastal California from San Luis Obispo County south into northwestern Baja California, Mexico from sea level to 7,000 feet (Jennings and Hayes 1994). The coast patch-nosed snake inhabits sandy and rocky areas on the lower slopes of mountains within grassland, chaparral, sage scrub, and desert scrub habitats. This snake is diurnal and active from March to October (Klauber 1939), although juveniles can be active on warm winter days (Jennings and Hayes 1994). The major prey items of the coast patch-nosed snake are whiptail lizards (*Cnemidophorus* spp.). Habitat loss and fragmentation from urbanization and conversion to agriculture are the main threats to this species.

Two-striped garter snake (*Thamnophis hammondi*). The two-striped garter snake is a CDFG species of special concern. The two-striped garter snake ranges from San Luis Obispo County south to El Rosario in Baja California, Mexico from sea level to 8,000 feet (Jennings and Hayes 1994). They are normally found in or near permanent fresh water, inhabiting streams, ponds, and lakes throughout their range (Stebbins 1985) and can even be found in temporary bodies of water such as vernal pools. The two-striped garter snake inhabits riparian areas during summer months and occupies adjacent coastal sage scrub and grasslands during the winter (Jennings and Hayes 1994). The two-striped garter begins breeding in April and continues throughout the summer months. Adults feed on tadpoles, toads, insect larvae, fish, fish eggs, and earthworms. Population declines in the two-striped garter snake are generally attributable to impacts related to the loss of natural wetlands and increased development near and in suitable habitat.

Attachment 10

Sensitive Wildlife Species Descriptions

(continued)

Sensitive Birds

Cooper's hawk (*Accipiter cooperii*). The Cooper's hawk is a CDFG species of special concern and is an MSCP covered species. The Cooper's hawk is a medium-sized raptor that ranges throughout most of the United States. It is considered an uncommon resident during the breeding season in southern California, with numbers increasing in winter (Garrett and Dunn 1981). This hawk mainly breeds in oak and willow riparian woodlands but will also use eucalyptus trees (Unitt 1984). This hawk forages primarily on songbirds but is also known to eat small mammals. Urbanization and loss of habitat have caused the decline of this species.

Sharp-shinned hawk (*Accipiter striatus*). The sharp-shinned hawk is a California species of special concern. Sharp-shinned hawks range throughout North America and are common migrants and rare summer residents in San Diego County (Unitt 1984). Sharp-shinned hawks are found in forested areas and breed in ponderosa pine, black oak, riparian deciduous, mixed conifer, and Jeffrey pine habitats, with a preference for riparian areas. Breeding occurs April through August. Foraging often occurs where migrating birds are found, such as in openings at edges of woodlands, hedgerows, brushy pastures, and shorelines. The sharp-shinned hawk diet consists mostly of small birds, small mammals, insects, reptiles, and amphibians. Threats to the sharp-shinned hawk include falconry and logging.

Tricolored blackbird (*Agelaius tricolor*). The tricolored blackbird is a CDFG species of special concern and an MSCP covered species. The tricolored blackbird ranges throughout lowland regions of California, west of the Sierra-Nevada Mountains. These blackbirds are typically found in large flocks in freshwater marsh habitat dominated by cattails, willows, mule fat, or tamarisk. They forage in agricultural and disturbed areas, along lake shores, and in wet meadows. Populations of this species are declining as a result of the elimination of wetlands and freshwater marsh habitat in California.

Southern California rufous-crowned sparrow (*Aimophila ruficeps canescens*). The southern California rufous-crowned sparrow is a CDFG species of special concern and an MSCP covered species. This subspecies of rufous-crowned sparrow is a resident and ranges throughout southern California from Los Angeles County to Baja California, Mexico along the Transverse and Peninsular Ranges (Collins 1999). Southern California rufous-crowned sparrows are found in chaparral and coastal sage scrub habitats and occasionally in grasslands adjacent to these habitats. The species exhibits a strong preference for moderate to steep, dry, rocky slopes interspersed with grasses and rock

Attachment 10

Sensitive Wildlife Species Descriptions

(continued)

outcrops (Unitt 1984, Collins 1999). Breeding occurs from March through June and pair bonds are formed that may last year-round (Collins 1999). Their diet consists primarily of seeds, stems, and shoots and extends to insects during spring and summer months (Wolf 1977). Urbanization, range restrictions, and the loss of habitat have decreased the amount of suitable habitat for southern California rufous-crowned sparrows.

Grasshopper sparrow (*Ammodramus savannarum*). The grasshopper sparrow has no official resource agency status but is considered locally sensitive. Grasshopper sparrows are a localized summer resident in San Diego County and very rare in winter (Unitt 1984). This species has a patchy distribution within grasslands along coastal California and the foothills of the Sierra Nevada.

Bell's sage sparrow (*Amphispiza belli belli*). Bell's sage sparrow is a CDFG species of special concern. Its breeding range is along the coastal slopes from Trinity County south into northwestern Baja California, Mexico. The Bell's sage sparrow is a rare resident along the coast of California in dry chaparral and coastal sage scrub along coastal lowlands and mountain foothills (Garrett and Dunn 1981). Locally, it can be found in the interior chaparral and coastal sage scrub habitats, especially in dense stands of chamise chaparral (Small 1994). Bell's sage sparrows exhibit high site tenacity to breeding territory and may be present up to a year after its habitat has been altered dramatically (Martin and Carlson 1998). This species feeds primarily on seeds during the winter and expands its diet to include spiders, insects, small fruit, and succulent vegetation during the breeding season (Martin and Carlson 1998). Threats to this species include loss and degradation of habitat, expansion of exotic grasses, introduced animals, and predation from feral cats.

Golden eagle (*Aquila chrysaetos*). The golden eagle is a federally protected species under the Bald and Golden Eagle Protection Act, is a CDFG species of special concern, is fully protected by the state of California, and is an MSCP covered species. This eagle occurs throughout the United States, and is an uncommon resident in San Diego County. Golden eagles forage over large areas of grassland and open chaparral or sage scrub, where they primarily prey upon rabbits and ground squirrels. The nesting population in San Diego County is concentrated in the foothill zone and coastal lowlands. Golden eagles nest on cliffs or in large trees. Several golden eagle territories in the coastal lowland have been eliminated by urbanization, agricultural development, and other human disturbances (Unitt 1984).

Attachment 10

Sensitive Wildlife Species Descriptions

(continued)

Swainson's hawk (*Buteo swainsoni*). Swainson's hawk is a state-listed threatened species and is an MSCP covered species. This raptor formerly nested throughout most of the state and was once described as the most common breeding hawk in the coastal lowlands. Its breeding range in the state is currently limited to the Central Valley, the Modoc Plateau, and small isolated patches of the high desert. Swainson's hawk nests in sycamores and cottonwoods in riparian areas. Swainson's hawk is a rare migrant in San Diego County in the spring and fall (Unitt 1984). Food items include spring emergent caterpillars. The main threat to Swainson's hawk populations is pesticide use in agricultural fields.

Coastal cactus wren (*Campylorhynchus brunneicapillus couesi*). The coastal cactus wren is a CDFG species of concern and is an MSCP covered species. The coastal cactus wren ranges from southern Orange County to Valle de las Palmas in Baja California, just south of the U.S.-Mexico border. Year-round residents in San Diego, coastal cactus wrens inhabit coastal lowlands containing thickets of cholla and prickly pear cactus in coastal sage and maritime succulent scrub (Unitt 1984). They nest in the cactus and can have multiple nests at any given time of year. The primary cause for the decline of this species is habitat loss due to urbanization.

Vaux's swift (*Chaetura vauxi vauxi*). Vaux's swift is a CDFG species of special concern. This swift is a fairly common spring and fall migrant in San Diego County (Garrett and Dunn 1981). This species migrates in flocks and on a cloudy spring day, flocks reaching 500 individuals can be seen in coastal areas (Unitt 1984). This is a fast-flying, grayish bird with long, pointed wings and a stubby tail (Peterson 1990). While in flight, the Vaux's swift looks like a cigar with wings. This species breeds in coniferous forests such as the coast redwoods and Douglas firs of the sequoia region.

Northern harrier (*Circus cyaneus hudsonius*). The northern harrier is a CDFG species of special concern and is an MSCP covered species. Northern harrier nesting sites are considered sensitive. This species ranges throughout most of the United States (National Geographic Society 1999). In San Diego County, the northern harrier is a fairly common migrant in the winter and a rare summer breeder (Unitt 1984). The northern harrier hovers close to the ground while foraging in grasslands, agricultural fields, and coastal marshes. The northern harrier most commonly nests on the ground at the edge of marshes, but will also nest on grasslands, fields, or in areas of sparse shrubs (Zeiner et al. 1990). The range of this species has been reduced due to urbanization and agricultural development.

Attachment 10

Sensitive Wildlife Species Descriptions

(continued)

Yellow warbler (*Dendroica petechia*). The yellow warbler is a CDFG species of special concern. This migratory warbler is found during the summer breeding season throughout California, migrating to Central and South America for the winter, where it spends nine months out of the year. Yellow warblers are common breeders on the Santa Margarita River in northern San Diego County. The yellow warbler is restricted to riparian woodland habitat for breeding (Unitt 1984). This species is declining due to the loss of riparian habitat and as a result of nest parasitism by brown-headed cowbirds.

White-tailed kite (*Elanus leucurus*). The white-tailed kite is a California fully protected species that occurs in coastal lowland areas from Oregon to northern Baja California, Mexico (National Geographic Society 1983). This resident bird nests in riparian woodlands, live oaks, or sycamore groves which border grassland or open fields (Unitt 1984). The white-tailed kite forages over open areas and grasslands feeding primarily on small rodents and insects (National Geographic Society 1983). This species is known to roost in large communal groups (Unitt 1984). White-tailed kite populations in southern California have declined due to the loss of nesting and foraging habitat.

Southwestern willow flycatcher (*Empidonax traillii extimus*). The southwestern willow flycatcher is federally and state listed as endangered and is an MSCP covered species. This migratory bird breeds in southern California, Arizona, New Mexico, extreme southern portions of Nevada and Utah, western Texas, and extreme northwestern Baja California, Mexico (USFWS 1995). The southwestern willow flycatcher is present in San Diego County in late spring and summer, where it is known to breed in only a few locations (Unitt 1984). This flycatcher requires mature willow thickets in riparian woodland habitat for breeding and nesting activities.

California horned lark (*Eremophila alpestris actia*). The California horned lark is a CDFG species of special concern. The horned lark (*E. alpestris*) ranges throughout North America. However, the range of the California horned lark subspecies is limited to the coastal slopes of California from Sonoma County to San Diego County and includes most of the San Joaquin Valley (Grinnell and Miller 1944). California horned larks occur in coastal San Diego County during the breeding season. In San Diego County, the California horned lark typically inhabits areas with sparse vegetation, including sandy shores, grasslands, mesas, and agricultural lands. Decline of this species is generally attributed to urbanization and human disturbance.

Attachment 10

Sensitive Wildlife Species Descriptions

(continued)

Yellow-breasted chat (*Icteria virens*). The yellow-breasted chat is a CDFG species of special concern. This bird can be found throughout most of the continental United States. It is present in San Diego County during the spring and summer months (National Geographic Society 1983). The yellow-breasted chat breeds in dense brush or scrub, usually along streams or marshy areas with dense riparian woodlands. It feeds mainly on insects and berries. Destruction of riparian woodlands by development and other human activities has caused population declines and it is possible that brown-headed cowbird parasitism may also have contributed to the decline of the species.

Loggerhead shrike (*Lanius ludovicianus*). The loggerhead shrike is a CDFG species of special concern. This species inhabits most of the continental U.S. and Mexico and is a year-round resident of southern California. The loggerhead shrike prefers open habitat with perches for hunting and fairly dense shrubs for nesting (Small 1994). In southern California, this bird inhabits grasslands, agricultural fields, chaparral, and desert scrub (Unitt 1984). Loggerhead shrikes feed on small reptiles and insects that they often impale on sticks or thorns before eating. Loggerhead shrike populations are declining, likely due to urbanization and loss of habitat.

Coastal California gnatcatcher (*Polioptila californica californica*). The coastal California gnatcatcher is federally-listed as threatened, a CDFG species of special concern, and an MSCP covered species. The coastal California gnatcatcher is a resident species restricted to the coastal slopes of southern California, from Ventura County southward through Los Angeles, Orange, Riverside, and San Diego Counties into Baja California, Mexico (Atwood 1980; Jones and Ramirez 1995). The coastal California gnatcatcher typically occurs in coastal sage scrub, although this bird also uses chaparral, grassland, and riparian woodland habitats where they occur adjacent to coastal sage scrub. Populations of this species have declined as a result of urban and agricultural development (Unitt 1984; Atwood 1990).

Western bluebird (*Sialia mexicana*). The western bluebird is an MSCP covered species. This species is generally a common year-round resident throughout much of California, excluding the higher mountains and eastern deserts. During the spring, this bird breeds in open woodlands of oaks, riparian deciduous trees, or conifers with herbaceous understory and in winter, uses more open habitats as well. In the non-breeding season, western bluebirds will supplement their diet with berries of mistletoe, poison oak, and elderberry, among other species, and the presence of mistletoe berries may govern local occurrence in winter (Grinnell and Miller 1944). Western bluebirds generally require trees and

Attachment 10

Sensitive Wildlife Species Descriptions

(continued)

shrubs for cover and will nest and roost in cavities of trees or snags. Competition from European starlings and house sparrows has reduced eastern bluebird populations in parts of the eastern U.S., and threatens western bluebirds (Zeiner et al. 1990). Western bluebirds occur throughout the year in foothills and mountains of San Diego County and are also residents of the more inland parts of the coastal lowland (Unitt 1984).

Western burrowing owl (*Speotyto cunicularia hypugaea*). The western burrowing owl is a CDFG species of special concern and is an MSCP covered species. This species is primarily restricted to the western United States and Mexico (National Geographic Society 1983). A year-round resident in San Diego County, the burrowing owl ranges throughout the coastal lowlands in grasslands, agricultural areas, and coastal dunes (Unitt 1984). Additionally, burrowing owls winter throughout the county. The burrowing owl is nocturnal and perches during daylight at the entrance to its burrow or on low posts. Nesting occurs from March through August. Burrowing owls form pair-bonds for more than one year and exhibit high site fidelity, reusing the same burrow year after year (Ehrlich et al. 1988; Rich 1984; Feeney 1992). The female remains inside the burrow during most of the egg laying and incubation period and is fed by the male throughout brooding. When disturbed within their burrows, burrowing owls mimic the sound of a rattlesnake rattling (Ehrlich et al. 1988). Urbanization has greatly reduced the amount of suitable habitat for this species. Other contributions to the decline of this species include the poisoning of squirrels and prairie dogs and collisions with automobiles.

Least Bell's vireo (*Vireo bellii pusillus*). The least Bell's vireo is federally and state listed as endangered and is an MSCP covered species. Its historical breeding range once extended from northwestern Baja California, Mexico, to interior northern California, as far north as Red Bluff in Tehama County, California (Franzreb 1989). This bird is found in riparian habitats, generally dominated by willows and mule fat. It is a migratory species, wintering in Mexico and breeding in southern California and northern Baja California, Mexico. Least Bell's vireo arrives at the breeding grounds in mid-March and remains until September or October. Populations of least Bell's vireo have declined drastically due to extensive loss of riparian habitat to agricultural and urban development, including channelization and mining of streams and nest parasitism by brown-headed cowbirds (*Molothrus ater*). Extensive brown-headed cowbird trapping programs implemented in southern California have increased populations of this species (Griffith Wildlife Biology [GWB] 2001).

Attachment 10

Sensitive Wildlife Species Descriptions

(continued)

Sensitive mammals

Northwestern San Diego pocket mouse (*Chaetodipus fallax fallax*). The northwestern San Diego pocket mouse is a California species of special concern. It ranges from Los Angeles County and extreme southern San Bernardino County southward into west-central Baja California, Mexico (Hall 1981). In San Diego County, the northwestern San Diego pocket mouse is known from Del Mar, Dulzura, Jacumba, Lake Hodges, Pala, San Diego, and San Marcos (Bond 1977). Habitat for this species is most often sparse or disturbed coastal sage scrub or grasslands with sandy soils. Threats to this species include degradation of habitat and loss of habitat from development.

Mountain lion (*Felis concolor*). The mountain lion is a CDFG species of special concern and is an MSCP covered species. Mountain lions are widespread but uncommon in California, ranging from sea level to alpine meadows. Mountain lions are most abundant in riparian and bushy habitats, as long as mule deer (their primary food source) are present. Home ranges for adult animals range from 8 to 40 square kilometers, which is larger for males and smaller for females. Mountain lions have shown dramatic declines in southern California and their main threat is human development, which leads to fragmentation of the habitat. As the habitat is fragmented, the movement of the lions is restricted which increases the associations with humans (Zeiner et al. 1988).

San Diego black-tailed jackrabbit (*Lepus californicus bennettii*). The San Diego black-tailed jackrabbit is a federal species of concern and a CDFG species of special concern. It ranges from near Mt. Pinos (at the Kern-Ventura County line) southward and west of the Peninsular Range into Baja California (Hall 1981). This species can be found throughout southern California, with the exception of the high-altitude mountains. The black-tailed jackrabbit is strictly herbivorous, preferring habitat with ample forage such as grasses and forbs. It occupies open or semi-open habitats (such as coastal sage scrub and open chaparral areas). Forested and thick chaparral regions are not suitable (Bond 1977). The San Diego black-tailed jackrabbit breeds throughout the year, with the greatest number of births occurring from April to May.

San Diego desert woodrat (*Neotoma lepida intermedia*). The San Diego desert woodrat is a CDFG species of special concern. Its range extends through coastal areas from San Luis Obispo well into Baja California, inland to the San Bernardino Mountains and Julian (Hall 1981). The San Diego desert woodrat occurs west of the mountains in San Diego County within chaparral areas with a preference for rock outcrops (Bond 1977). The middens (nests) of this species can be occupied by multiple generations and have been

Attachment 10

Sensitive Wildlife Species Descriptions

(continued)

documented as old as 200 to 400 years of age. Threats to this species include habitat degradation and loss of habitat.

Southern mule deer (*Odocoileus hemionus fuliginata*). The southern mule deer is an MSCP covered species. Mule deer inhabit a variety of plant communities, including coastal sage scrub, chaparral, grassland, woodland, and riparian systems. The distribution of this species includes southern California west of the Peninsular range and south into Baja California Norte, Mexico. Adults' antlers may reach a four-foot spread. Mule deer primarily forage upon herbaceous plants, but will also eat various shrubs and trees (National Audubon Society 1991).

Southern Grasshopper Mouse (*Onychomys torridus ramona*). The southern grasshopper mouse is a CDFG species of special concern. This subspecies of the grasshopper mouse ranges from the coastal slopes of northern Los Angeles County south into extreme northwestern Baja California, Mexico. The southern grasshopper mouse occurs in a wide variety of arid habitats, including various types of brush lands, such as alkali desert scrub, coastal sage scrub, sage brush and bitterbrush. There is some evidence that the southern grasshopper mouse is at least sometimes associated with clumps of cacti or *Yucca* species. As they feed primarily on arthropods such as grasshoppers, beetles, and scorpions, these mice are not frequently caught in small mammal trapping studies which use vegetable or grass material as bait. As a result, little is currently known about the status of the southern grasshopper mouse in San Diego County.

ATTACHMENT 12
WILDLIFE SPECIES OBSERVED OR DETECTED ON PMA 1
(continued)

Relative Abundance (based on Garrett and Dunn 1981)

C = Common to abundant; almost always encountered in proper habitat, usually
in moderate to large numbers
F = Fairly common; usually encountered in proper habitat, generally not in large numbers
U = Uncommon; occurs in small numbers or only locally

Evidence of Occurrence

D = Den
M = Midden
N = Nesting/Breeding
O = Observed
S = Scat
T = Track
V = Vocalization

Coyote	<i>Canis latrans</i>	F	S	S	T/S	S	S	S	T/S	S	
Common raccoon	<i>Procyon lotor</i>	U		T							
Southern mule deer	<i>Odocoileus hemionus fulginata</i>	U			O						

+ Introduced species

Note: Species in **bold type** have sensitive status; see Attachment 10 for further details.

Relative Abundance (based on Garrett and Dunn 1981)

- C = Common to abundant; almost always encountered in proper habitat, usually in moderate to large numbers
F = Fairly common; usually encountered in proper habitat, generally not in large numbers
U = Uncommon; occurs in small numbers or only locally

Evidence of Occurrence

- B = Burrow
C = Carcass/remains
M = Midden
N = Nesting/Breeding
O = Observed
S = Scat
T = Track
V = Vocalization

<u>Invertebrates</u> (Nomenclature from Mattoni 1990 and Opler and Wright 1999)																			
Anise swallowtail	<i>Papilio zelicaon zelicaon</i>	U							O										
Western tiger swallowtail	<i>Papilio rutulus rutulus</i>	U																	O
Cabbage white	<i>Pieris rapae</i>	U													O				
Common or checkered white	<i>Pieris protodice</i>	C			O								O	O	O		O	O	
Sara orangetip	<i>Anthocaris sara</i>	F									O		O						
Queen	<i>Danaus gilippus</i>	U											O						
West coast lady	<i>Vanessa annabella</i>	U							O										
Mourning cloak	<i>Nymphalis antiopa antiopa</i>	U			O														
Buckeye	<i>Precis coenia</i>	U												O					
Behr’s metalmark	<i>Apodemia mormo virgulti</i>	F	O						O				O						
Common hairstreak	<i>Strymon melinus pudica</i>	U	O						O										
Pigmy blue	<i>Brephidium exilis</i>	U							O										
Western tailed blue	<i>Everes amyntula</i>	U								O			O						
Southern blue	<i>Glaucopsyche lygdamus australis</i>	U												O					
Funereal duskywing	<i>Erynnis funeralis</i>	U												O					
Fiery skipper	<i>Hylephila phyleus</i>	U	O						O		O								
<u>Reptiles</u> (Nomenclature from Crother 2001 and Crother et al. 2003)																			
Belding’s orange-throated whiptail MSCP COVERED SPECIES	<i>Aspidoscelis (=Cnemidophorus) hyperythrus beldingi</i>	U	O												O				
San Diego horned lizard MSCP COVERED SPECIES	<i>Phrynosoma coronatum blainvillii</i>	U													O				
Western fence lizard	<i>Sceloporus occidentalis</i>	U															O		
Common side-blotched lizard	<i>Uta stansburiana</i>	U							O										
Red diamond rattlesnake	<i>Crotalus exsul</i>	U	O												O				
California striped racer	<i>Masticophis lateralis lateralis</i>	U											O						
San Diego gopher snake	<i>Pituophis catenifer annectens</i>	U							O										
<u>Birds</u> (Nomenclature from American Ornithologists’ Union 1998 and Unitt 1984)																			
Double-crested cormorant	<i>Phalacrocorax auritus albociliatus</i>	U		O								O	O						
White-tailed kite	<i>Elanus leucurus</i>	U									O	O							
Northern harrier MSCP COVERED SPECIES	<i>Circus cyaneus hudsonius</i>	U									O								
Cooper’s hawk MSCP COVERED SPECIES	<i>Accipiter cooperii</i>	U	O										O	O					
Red-shouldered hawk	<i>Buteo lineatus elegans</i>	F		O									O						O
Swainson’s hawk MSCP COVERED SPECIES	<i>Buteo swainsoni</i>	U								O									
Red-tailed hawk	<i>Buteo jamaicensis</i>	F	O/V							O/V	O/V			O	O	O/V	O/V (N)		O
American peregrine falcon MSCP COVERED SPECIES	<i>Falco peregrinus</i>	U	O																
California quail	<i>Callipepla californica californica</i>	C											O/V	O/V					
Killdeer	<i>Charadrius vociferus vociferus</i>	U					V						O/V						
Gull	<i>Larus</i> sp.	U													O				

ATTACHMENT 18
WILDLIFE SPECIES OBSERVED OR DETECTED ON PMA 4

Southern California rufous-crowned sparrow MSCP COVERED SPECIES	<i>Aimophila ruficeps canescens</i>	U										O/V		O/V	O/V					
Song sparrow	<i>Melospiza melodia</i>	F			O/V	O/V		O/V				O/V	O/V	O/V	O/V	O/V	O/V	O/V	O/V	O/V
White-crowned sparrow	<i>Zonotrichia leucophrys</i>	F			O/V			O/V	O/V	O/V		O/V								
Red-winged blackbird	<i>Agelaius phoeniceus</i>	U												O/V						
Brown-headed cowbird	<i>Molothrus ater</i>	F												O/V						
Hooded oriole	<i>Icterus cucullatus</i>	U	O/V			O/V		O/V					O/V	O				O/V		
<u>Mammals</u> (Nomenclature from Jones et al. 1997 and Hall 1981)																				
Virginia opossum†	<i>Didelphis virginiana</i>	U												O						
Desert cottontail	<i>Sylvilagus audubonii</i>	F	O	O						O		O	O	O				O	O	O
California ground squirrel	<i>Spermophilus beecheyi</i>	U	O					O						O						
Southern pocket gopher	<i>Thomomys umbrinus</i>	U									B									
Woodrat	<i>Neotoma</i> spp.	U	M																	
Coyote	<i>Canis latrans</i>	F						S	S			S		S						
Common raccoon	<i>Procyon lotor</i>	U						T						T						
Southern mule deer MSCP COVERED SPECIES	<i>Odocoileus hemionus fulginata</i>	F									S			T						

†Introduced species
Note: Species in **bold type** have sensitive status; see Attachment 10 for further details.

Relative Abundance (based on Garrett and Dunn 1981)

- C = Common to abundant; almost always encountered in proper habitat, usually in moderate to large numbers
F = Fairly common; usually encountered in proper habitat, generally not in large numbers
U = Uncommon; occurs in small numbers or only locally

Evidence of Occurrence

- B = Burrow
M = Midden
N = Nesting/Breeding
O = Observed
S = Scat
T = Track
V = Vocalization
